## INTRODUCTION

- Sender Spoofing - What's the problem?
- History of Email
- SMTP Basics
- Email Authentication Mechanisms
- Why does any of this matter?
- Recommendations
- Real World DMARC Usage

# NZTA Notifications

## THE PROBLEM

**Waka Kotahi NZ Transport Agency** <no.reply@nzta.govt.nz>

18 Mar 2024, 14:51

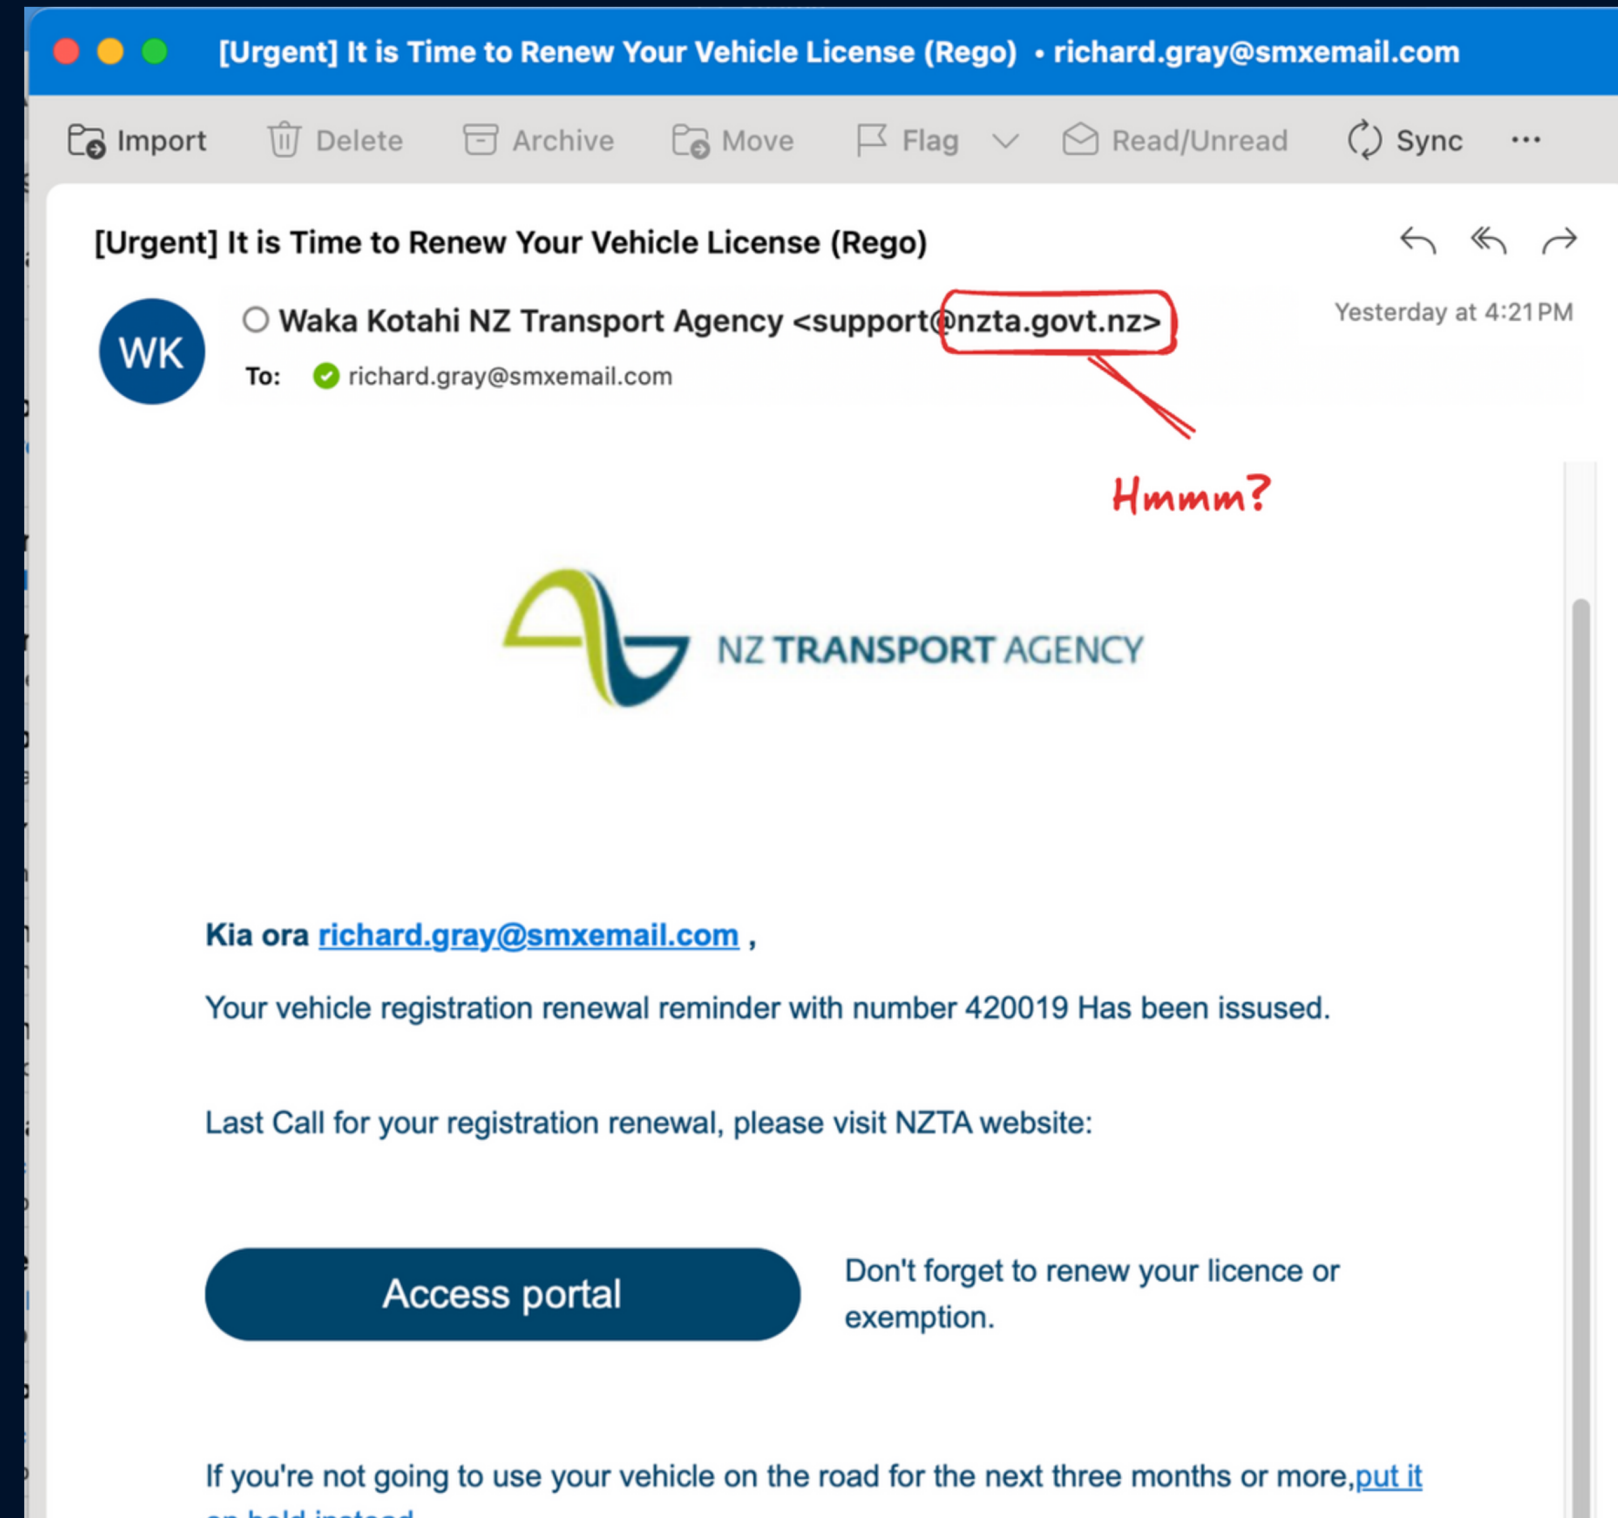

to me ▾

Genuine vehicle licence (rego) reminder emails from Waka Kotahi NZ Transport Agency always come from **@nzta.govt.nz** - they'll always include your plate number, vehicle make and the correct expiry date. If you're unsure, check the information in the email against the rego label on your vehicle.

**“Genuine vehicle licence reminder emails from Waka Kotahi NZ Transport Agency always come from [@nzta.govt.nz](mailto:nzta.govt.nz)” ...**

# NZTA - Phishing Example

## THE PROBLEM

# NZTA - DMARC Record

## THE PROBLEM

```
$ dig -t txt _dmarc.nzta.govt.nz +short  
"v=DMARC1; p=none; rua=mailto:XXXX@nzta.govt.nz;"
```

NZTA's DMARC Record (with minor edits for brevity)

# Ray Tomlinson

HISTORY OF EMAIL

Ray Tomlinson

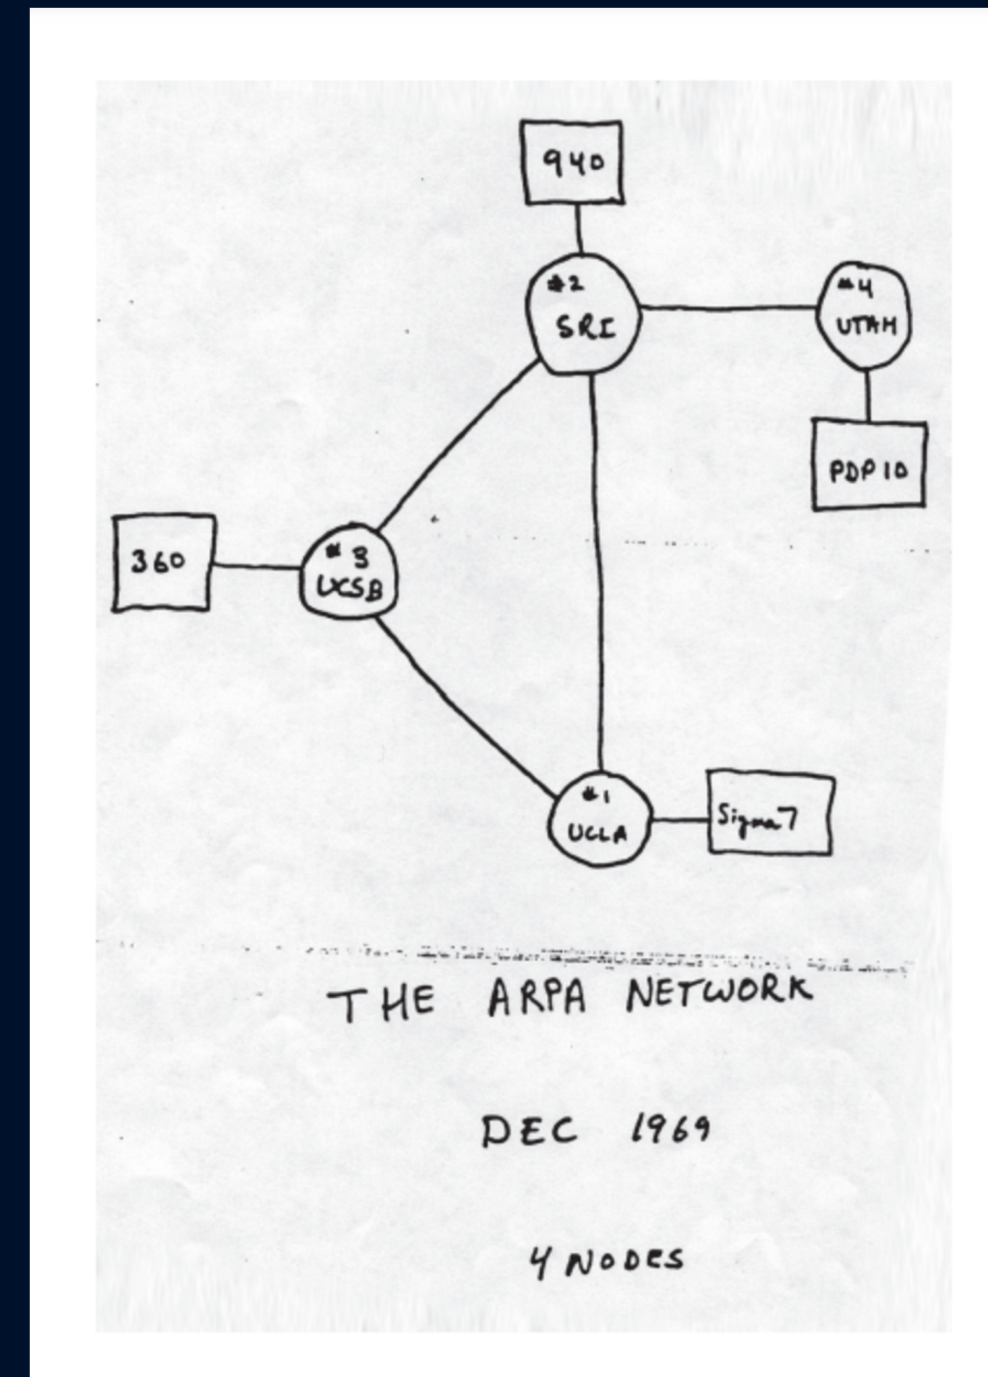

BBN-TENEXA & BBN-TENEXB

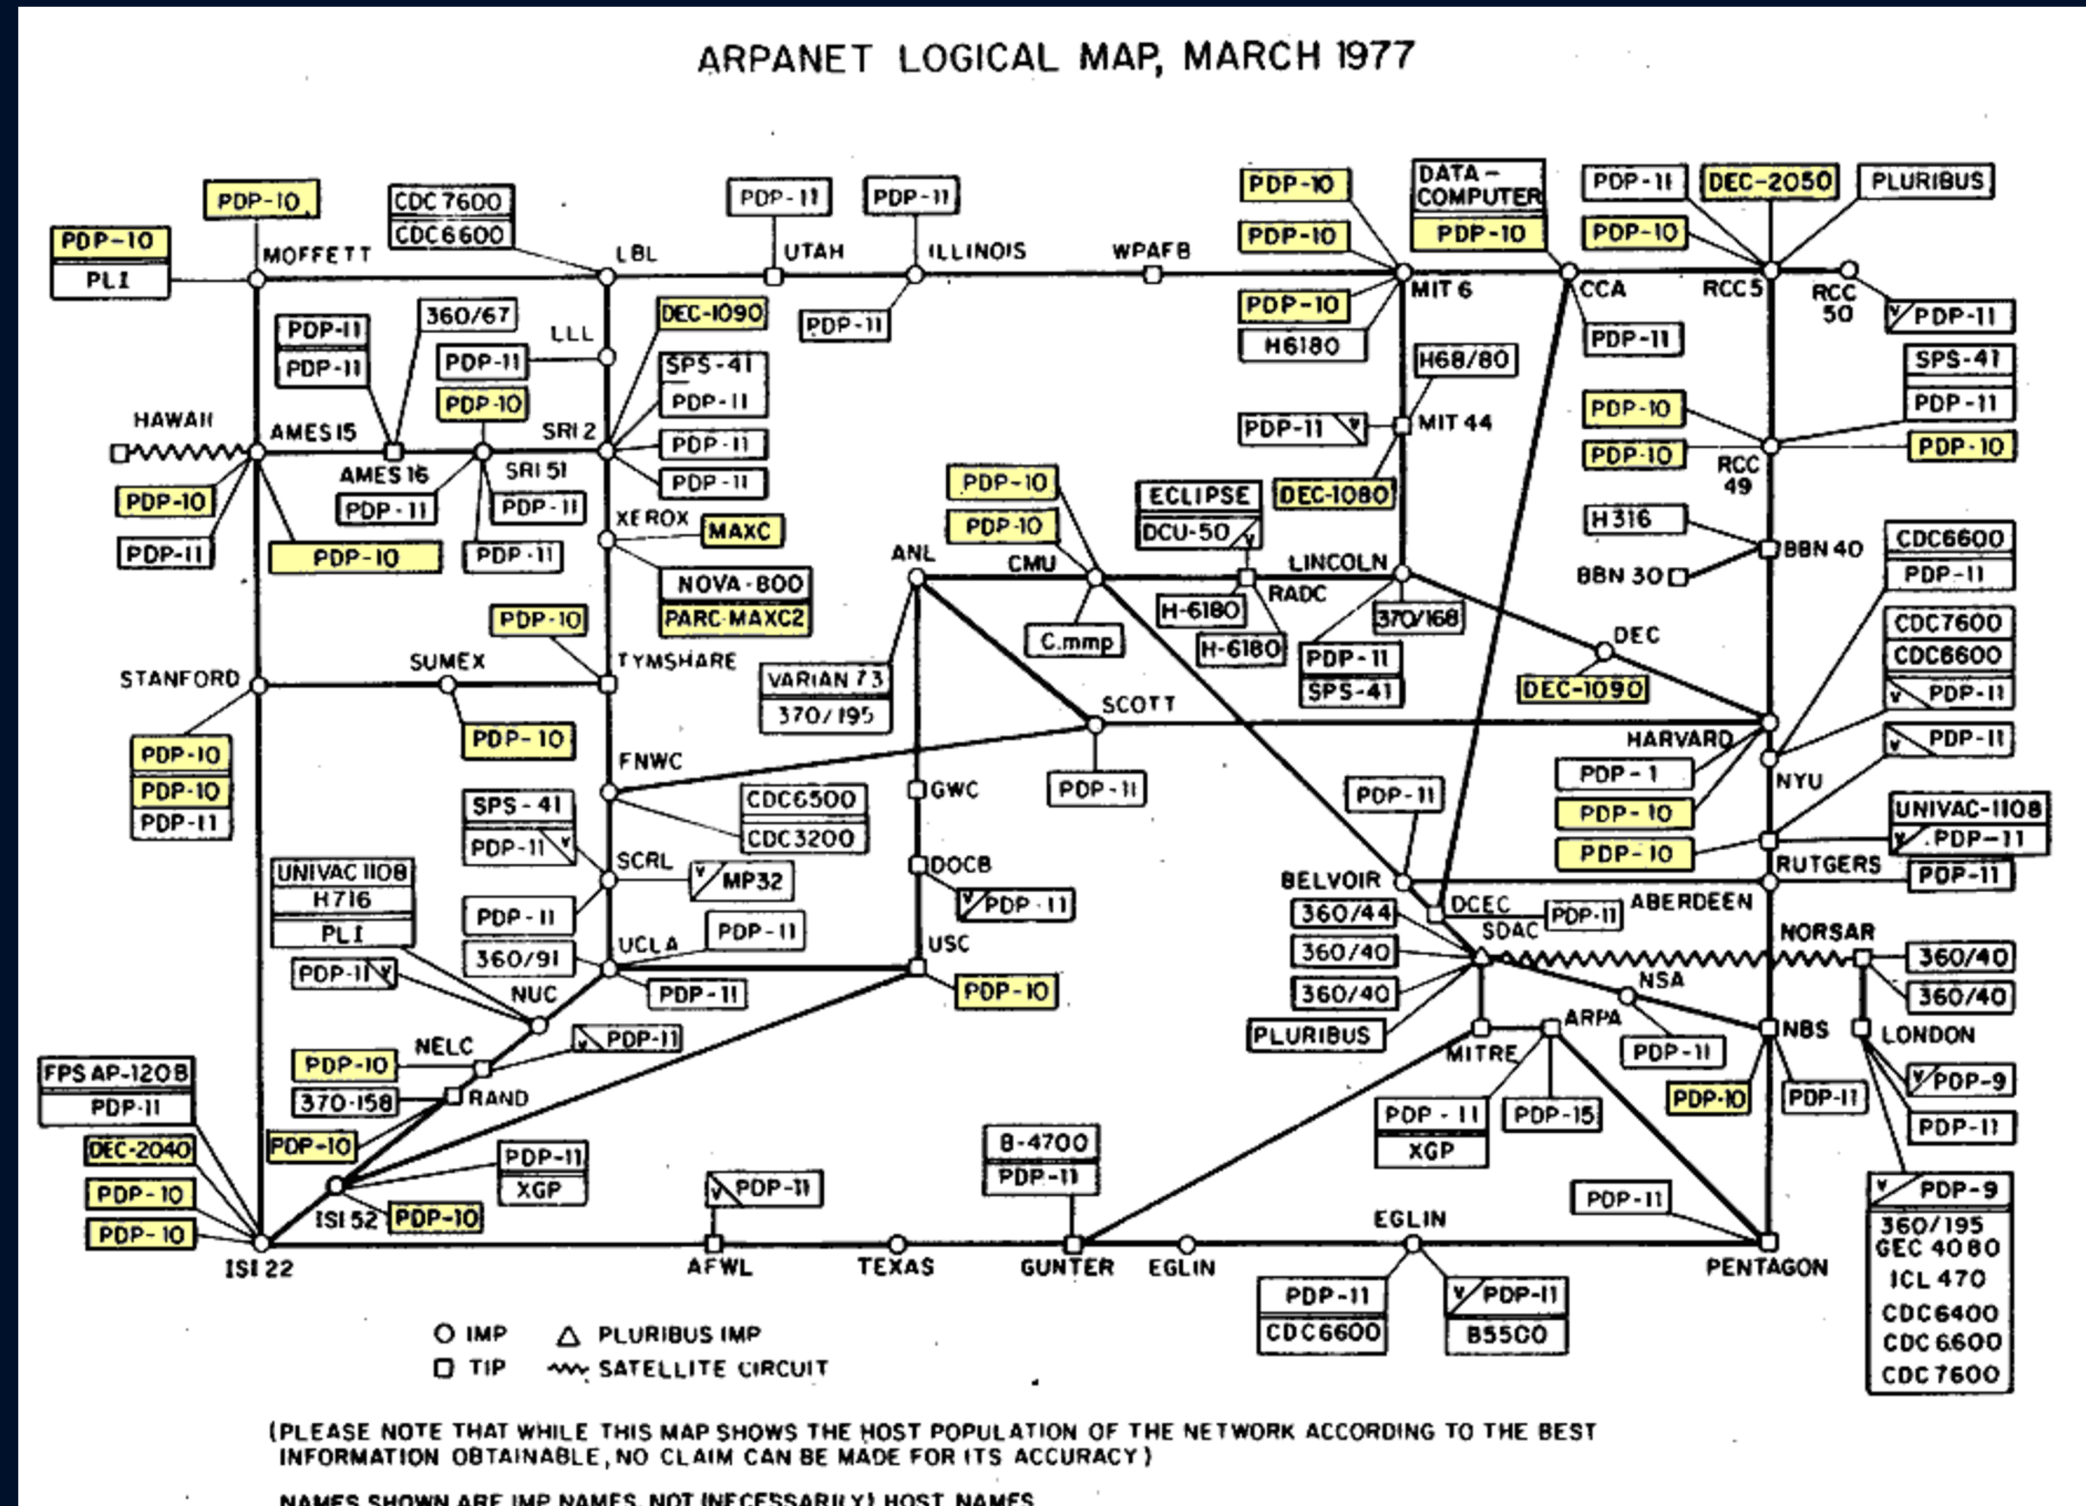

# The ARPANET - 1969

HISTORY OF EMAIL

# The ARPANET - 1977

## HISTORY OF EMAIL

# Setting the Scene

## HISTORY OF EMAIL

- A relatively small network with high barriers to entry (you needed a \$2M mainframe).
- Network participants largely known to each other.
- Government network not for commercial or personal use. Scope for abuse was not immediately apparent.
- Networking protocols under active development - priority of interoperability rather than security.

# Jon Postel

HISTORY OF EMAIL

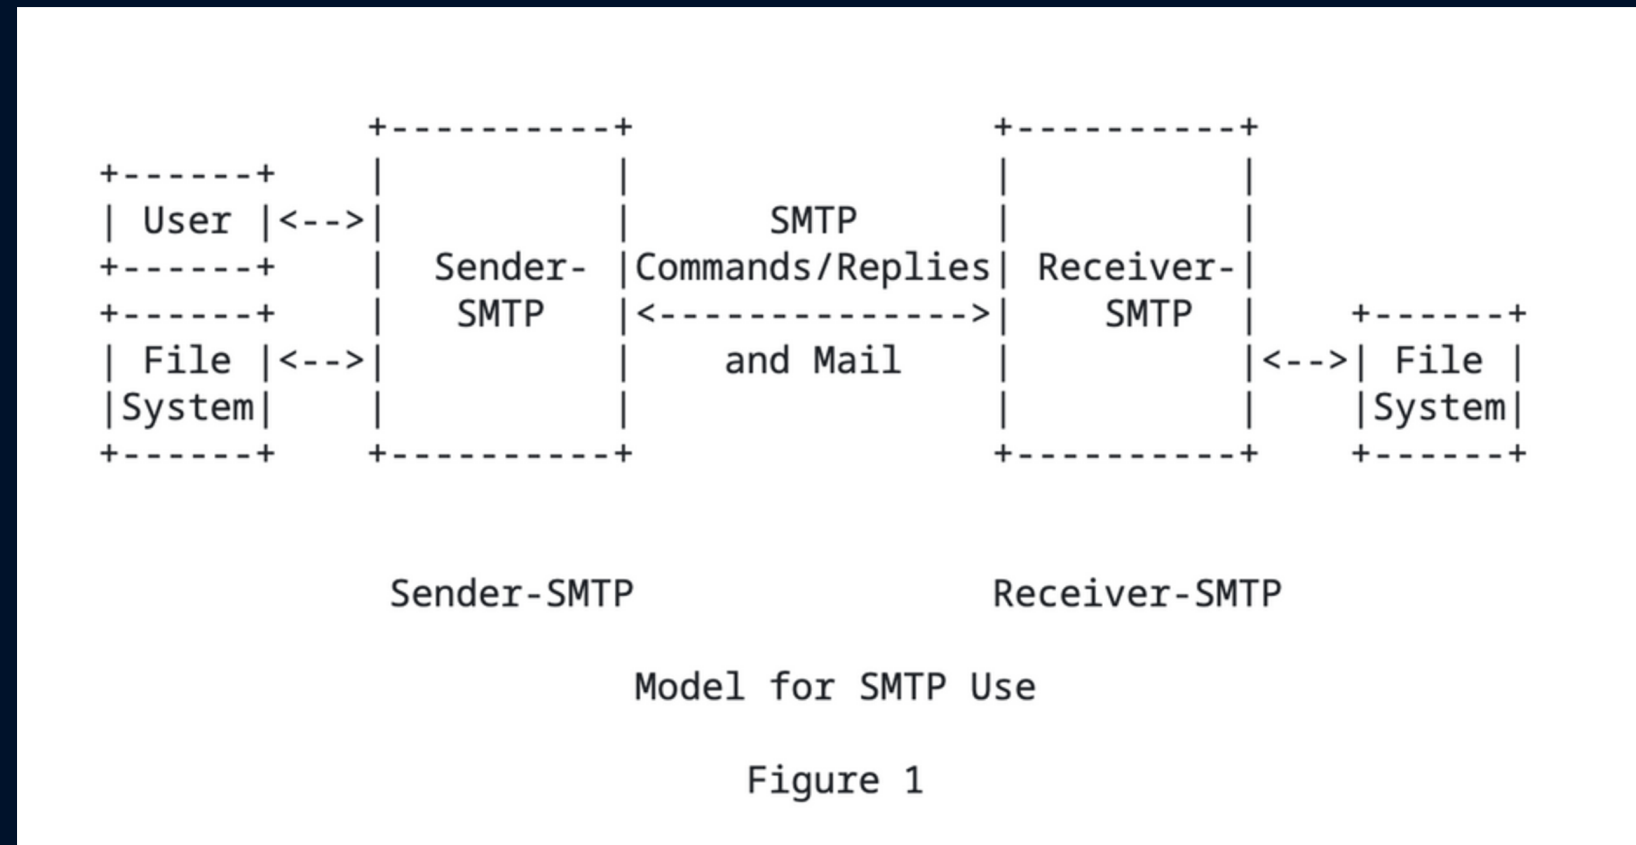

Postel's Law (a.k.a the Robustness Principle)

***"be conservative in what you send, be liberal  
in what you accept"***

- Coined by Jon Postel in RFC 761 - Transmission Control Protocol
- Sounds good, but has resulted in a long tail of challenges and security problems.

# SMTP - Simple Mail Transport Protocol

## HISTORY OF EMAIL

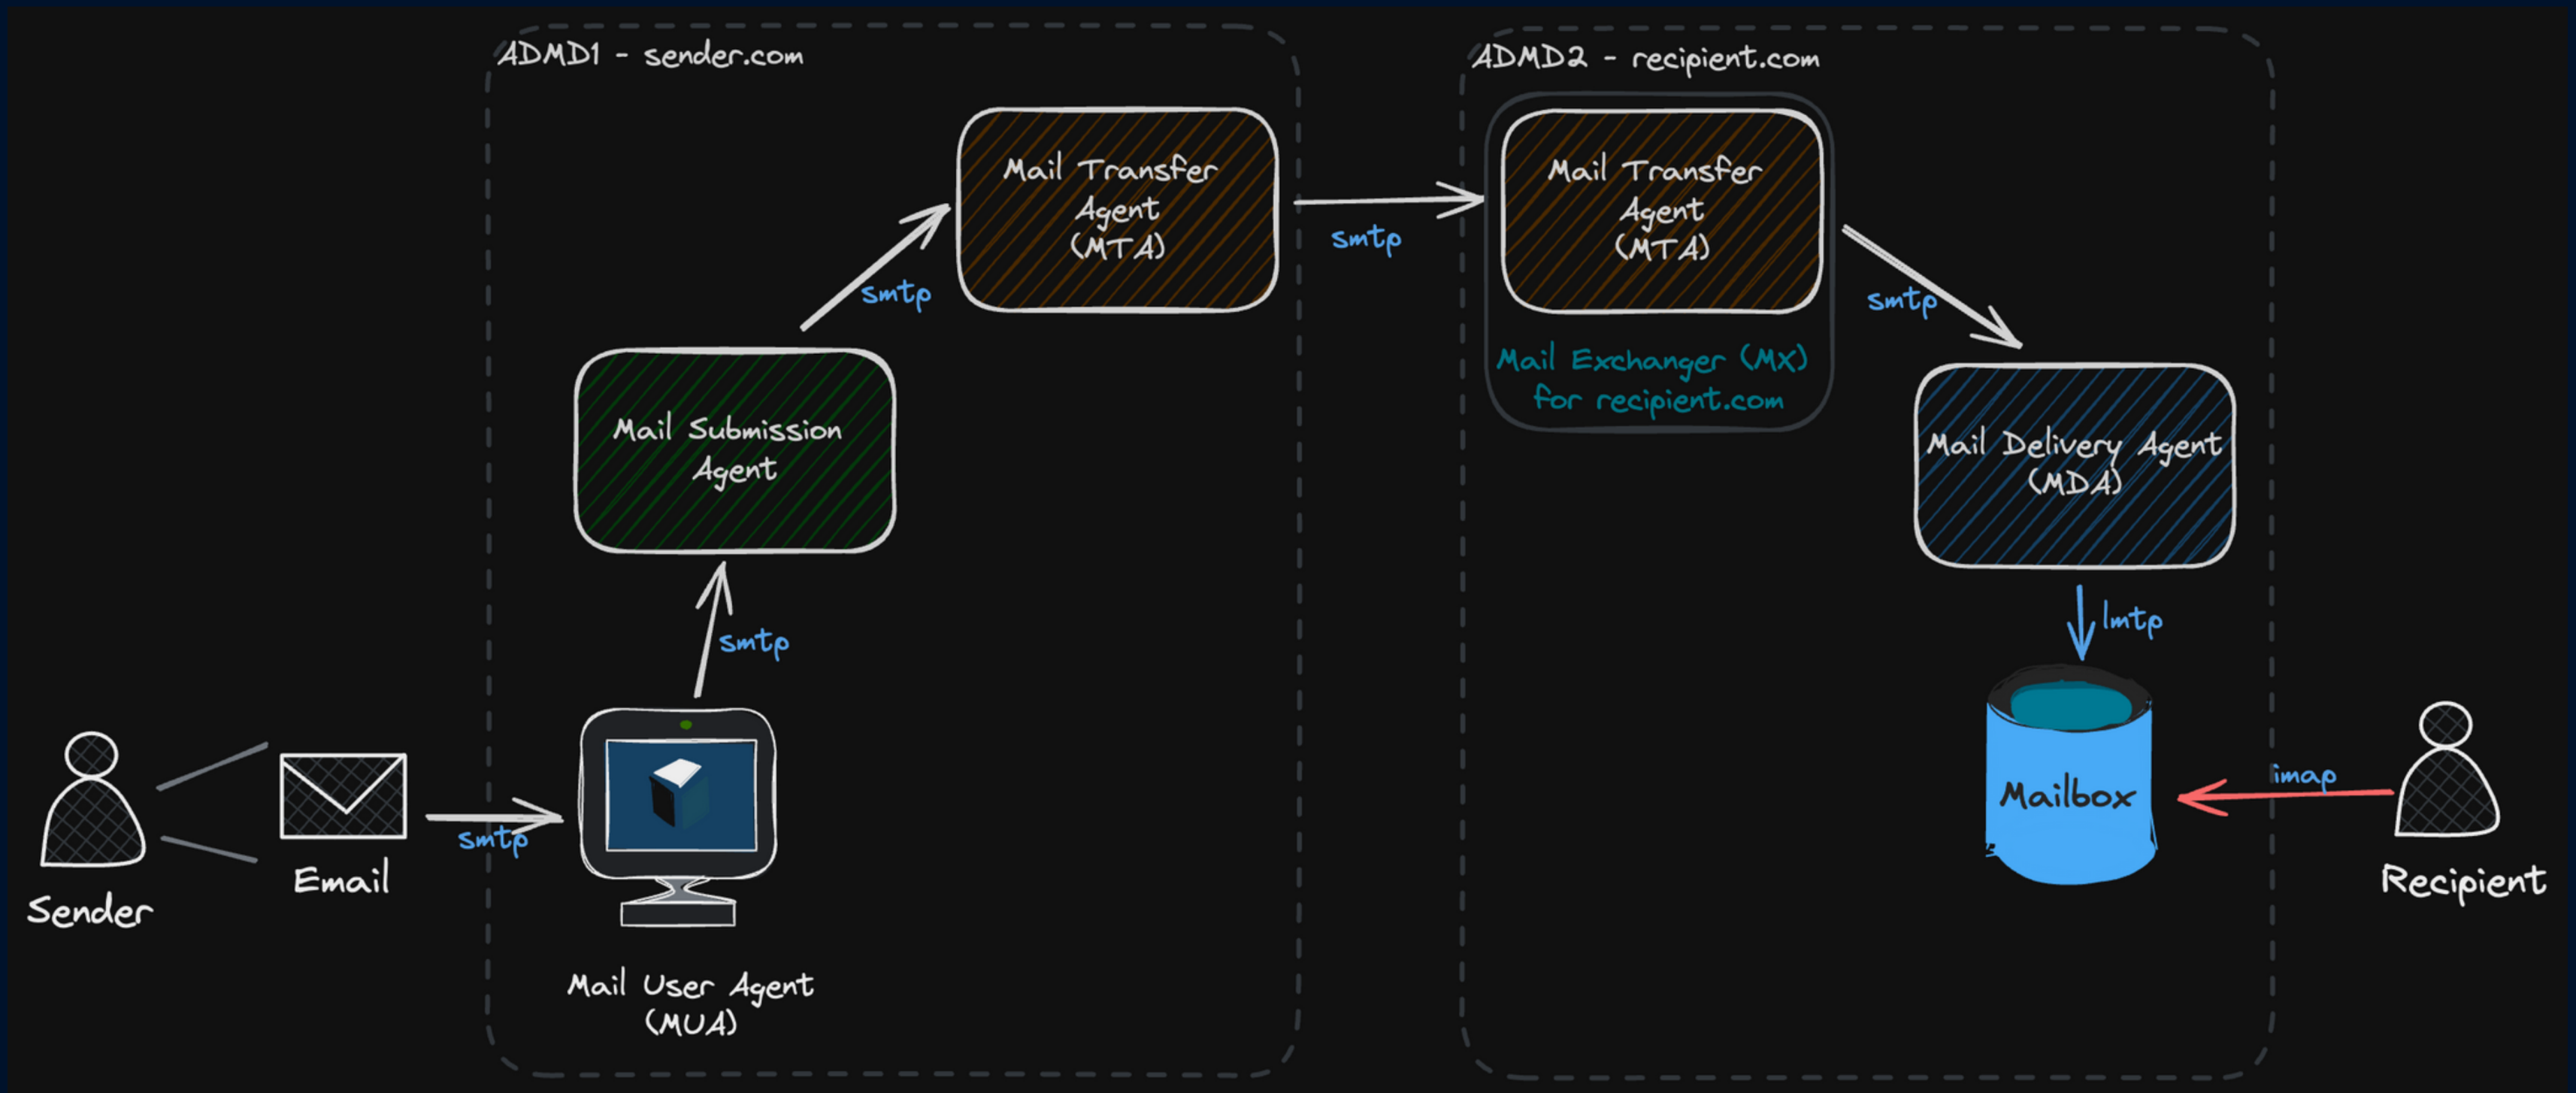

SMTP Model Diagram from RFC 788 (1981)

- First described in RFC 788, authored by Jon Postel and published in November 1981
- Grew from earlier mail protocols which relied on FTP as the underlying transport
- Although it has been developed and extended in subsequent RFCs, the basic protocol described in RFC 788 still closely resembles the SMTP we use today, 43 years later.

# Message Delivery

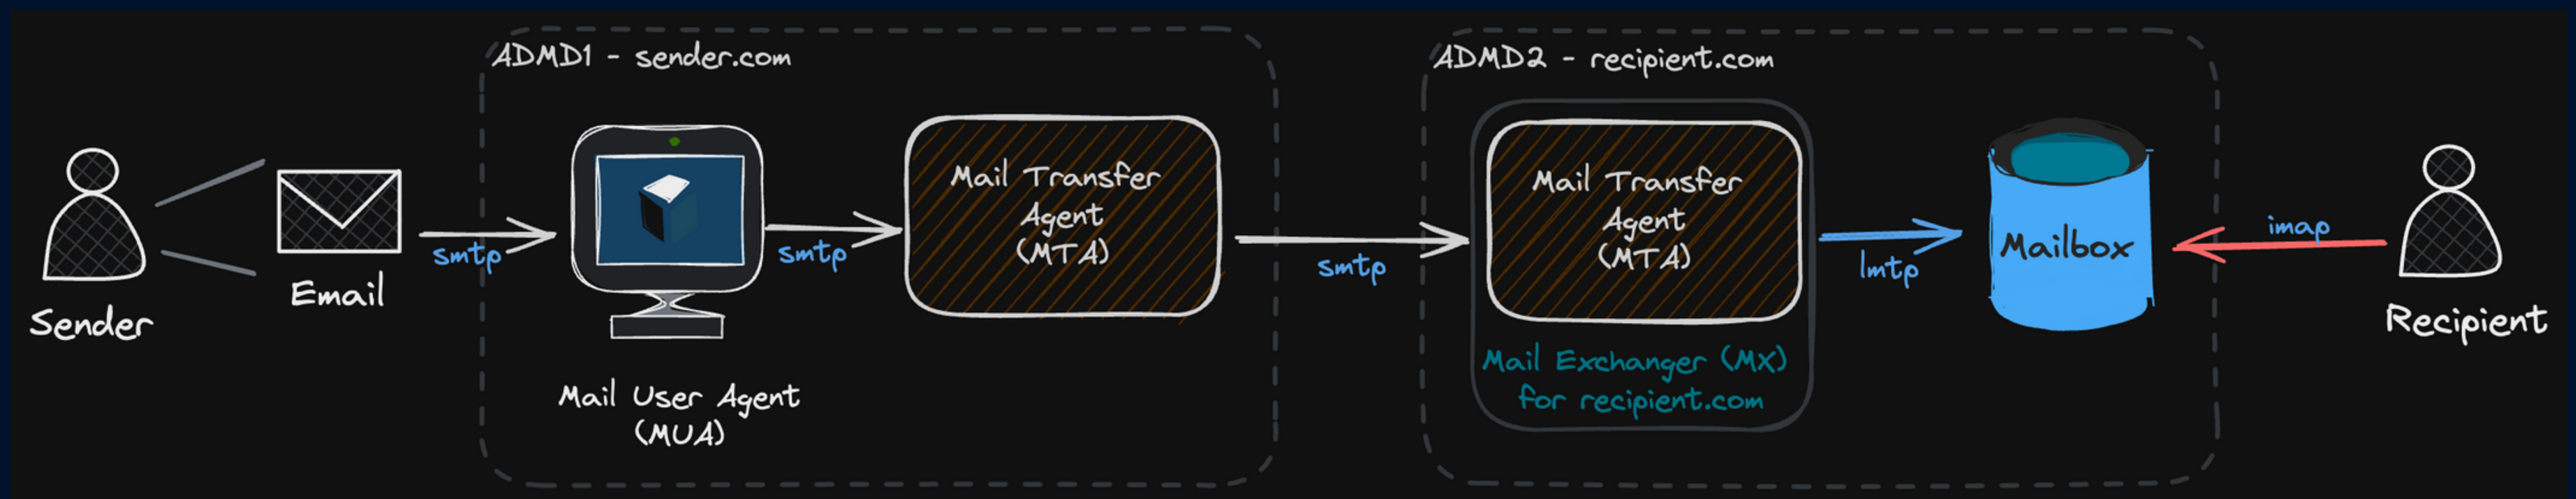

SMTP

SMTP Delivery Model

# Message Delivery - Simplified

SMTP

SMTP Delivery Model

# Open Relays

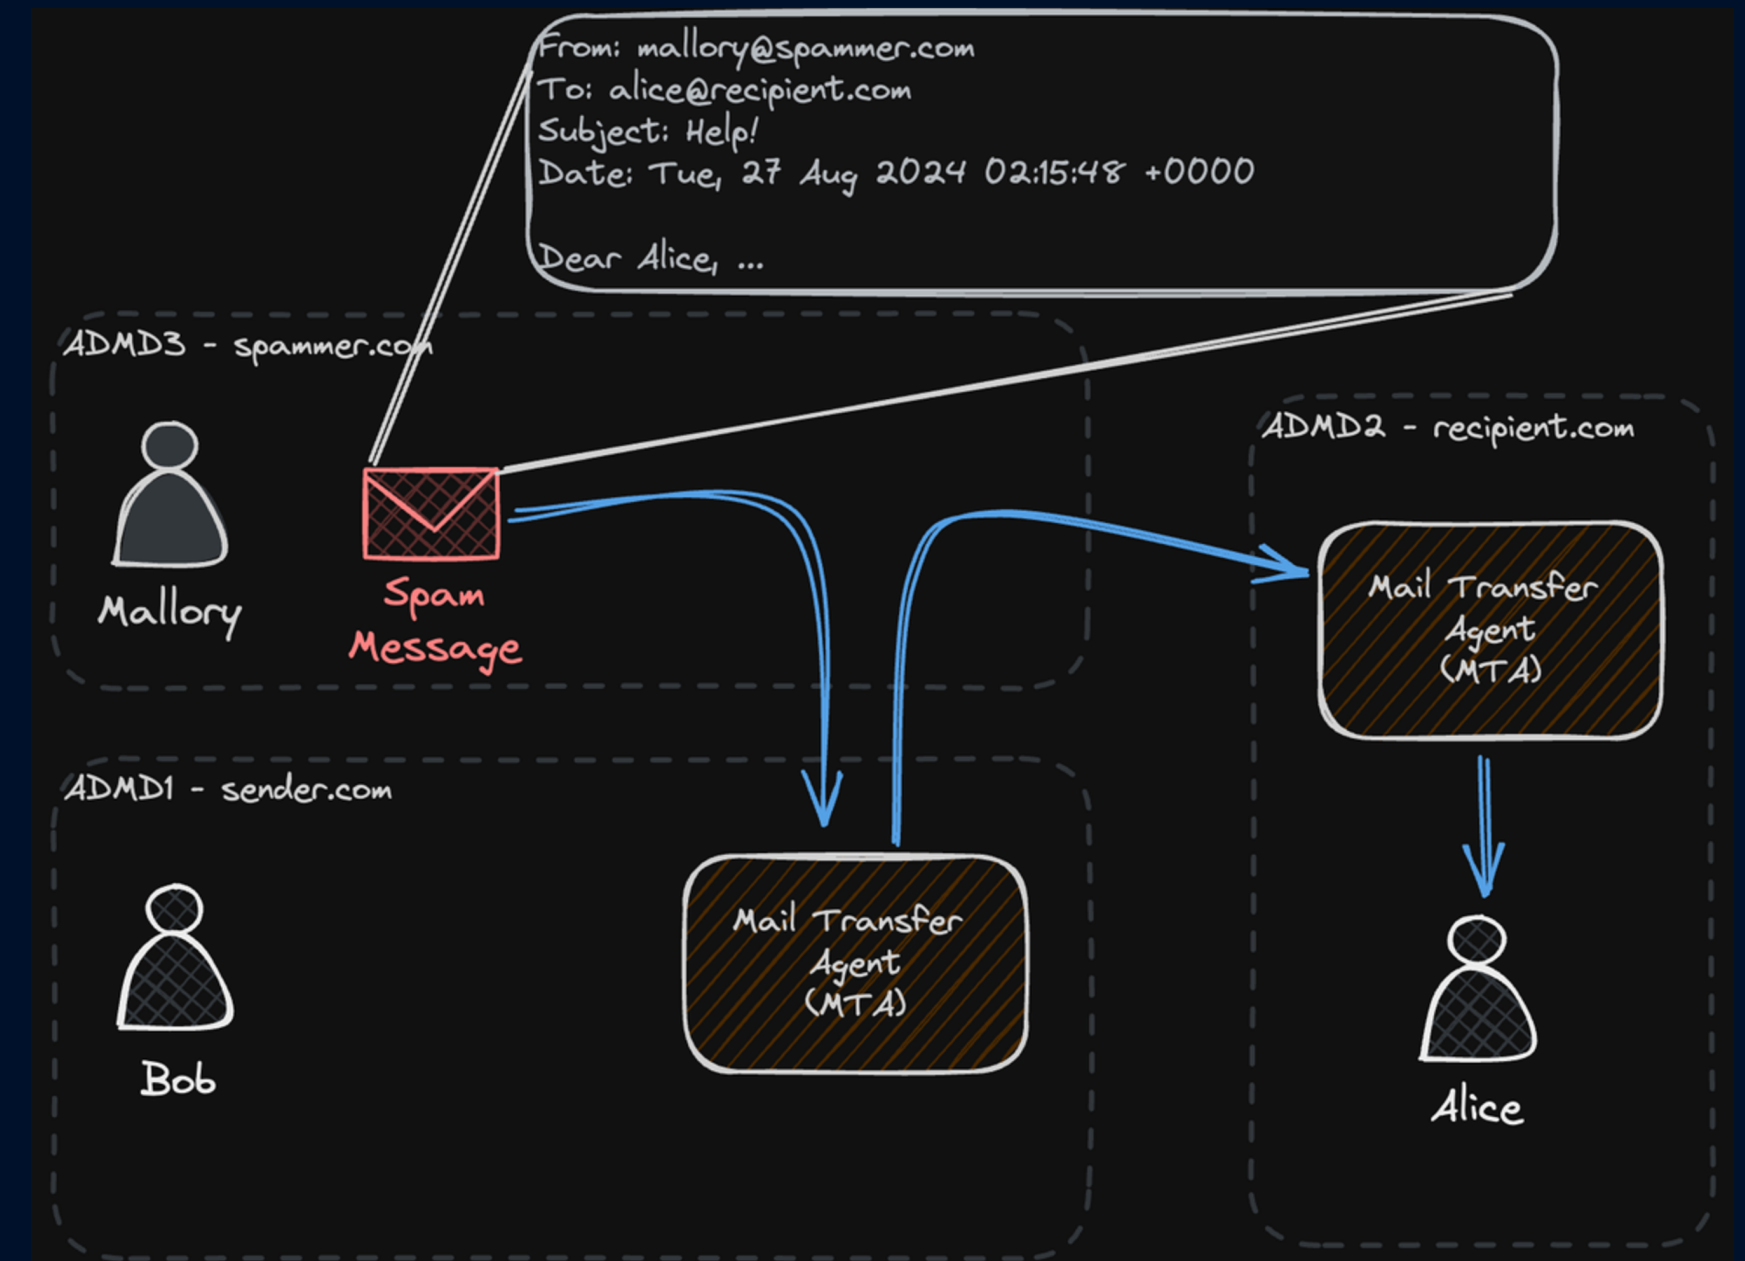

## SMTP PROBLEMS

An SMTP server that allows anyone to deliver mail through it, not just mail to or from known users.

- ✓ Local Source, Local Destination
- ✓ Local Source, Remote Destination
- ✓ Remote Source, Local Destination
- ✗ Remote Source, Remote Destination

To avoid being an open relay, mail servers must only accept mail from authenticated and authorized clients.

- Authenticated users (e.g. user/password authentication)
- Authorized IPs (local network)

# Message and Envelope

## SMTP BASICS

### Envelope

A wrapper around the email message containing routing information to support delivery of the message. The envelope identifies:

- The sender address
- The recipient address

### Message

Actual message content visible to the user, defined by RFC 2822 and containing:

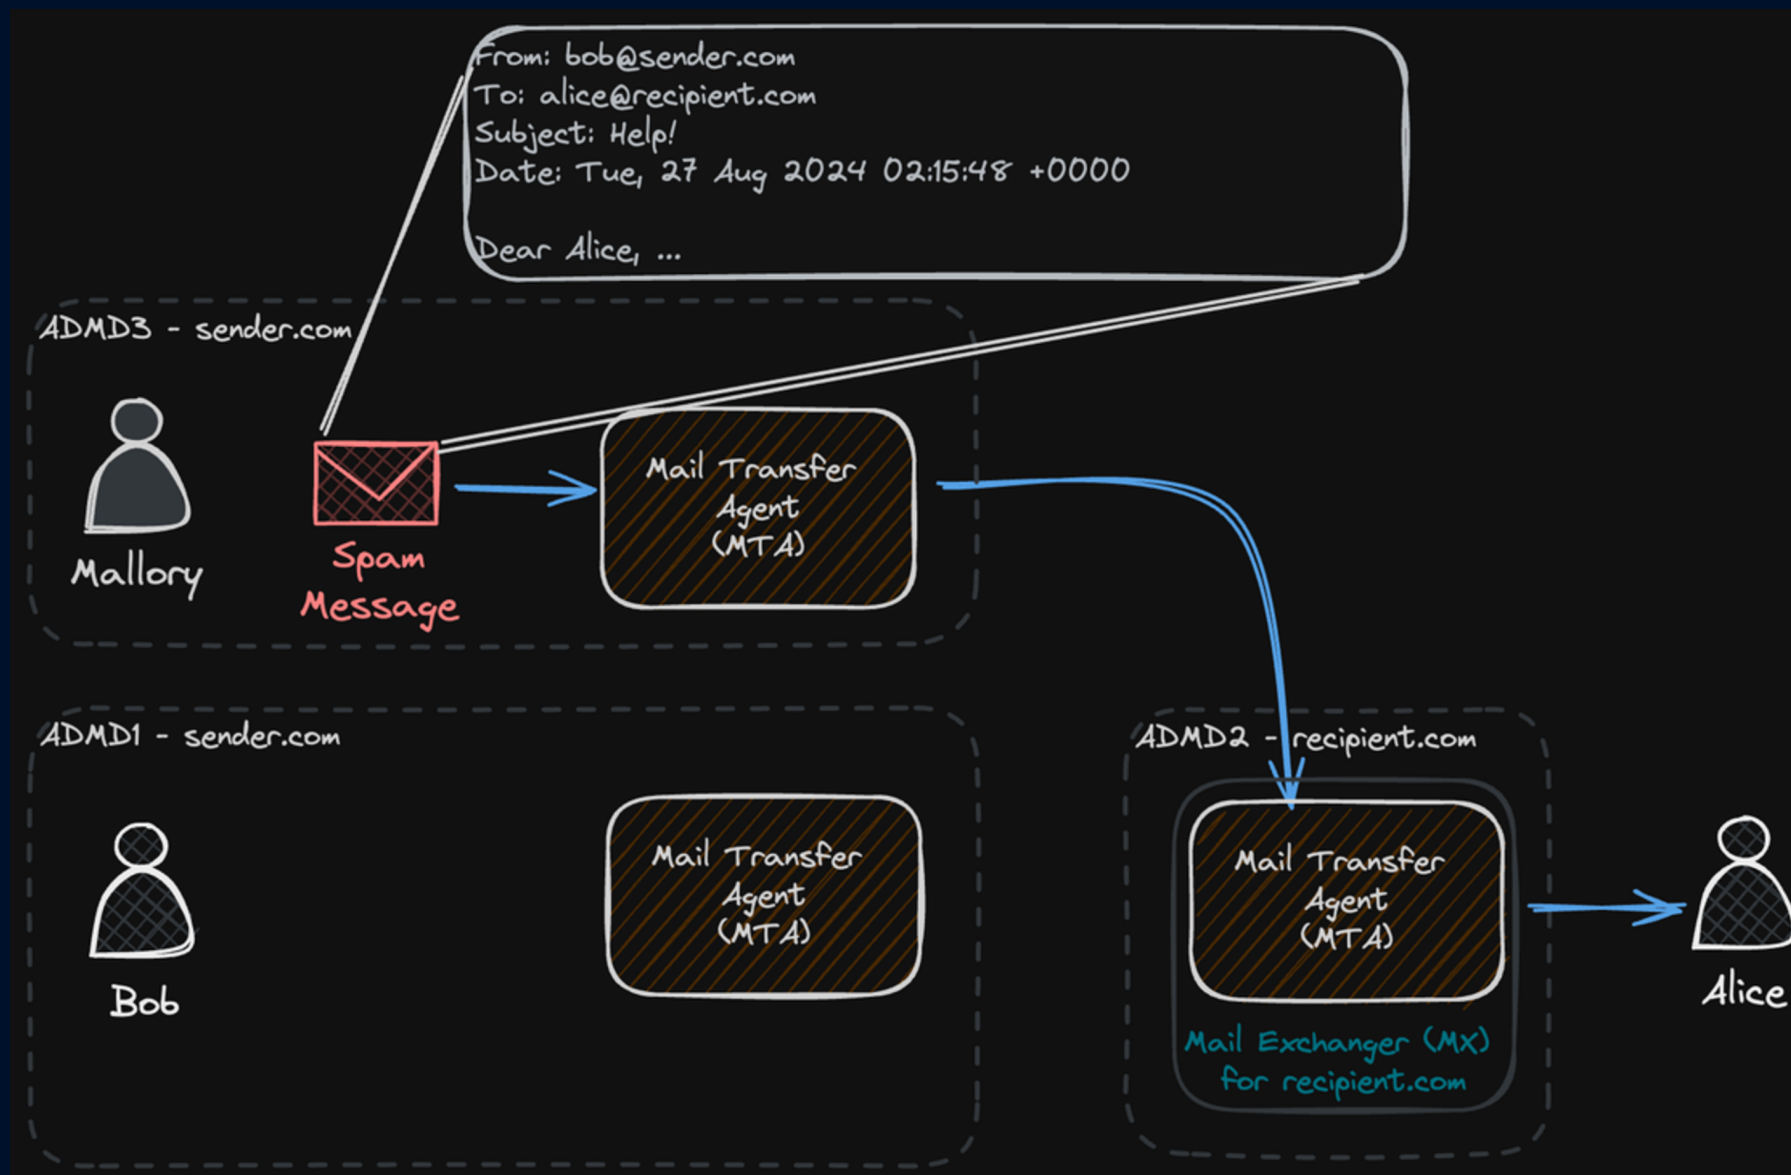

Headers - Metadata about the message including:

- From: the sender's email address as seen by the recipient.
- To: the recipient's email address
- Subject
- Date
- Message-ID
- Content-Type
- Various other headers

Body - the actual content of the message, which might be plain text, HTML, or both, and can include attachments.

# Sender Spoofing

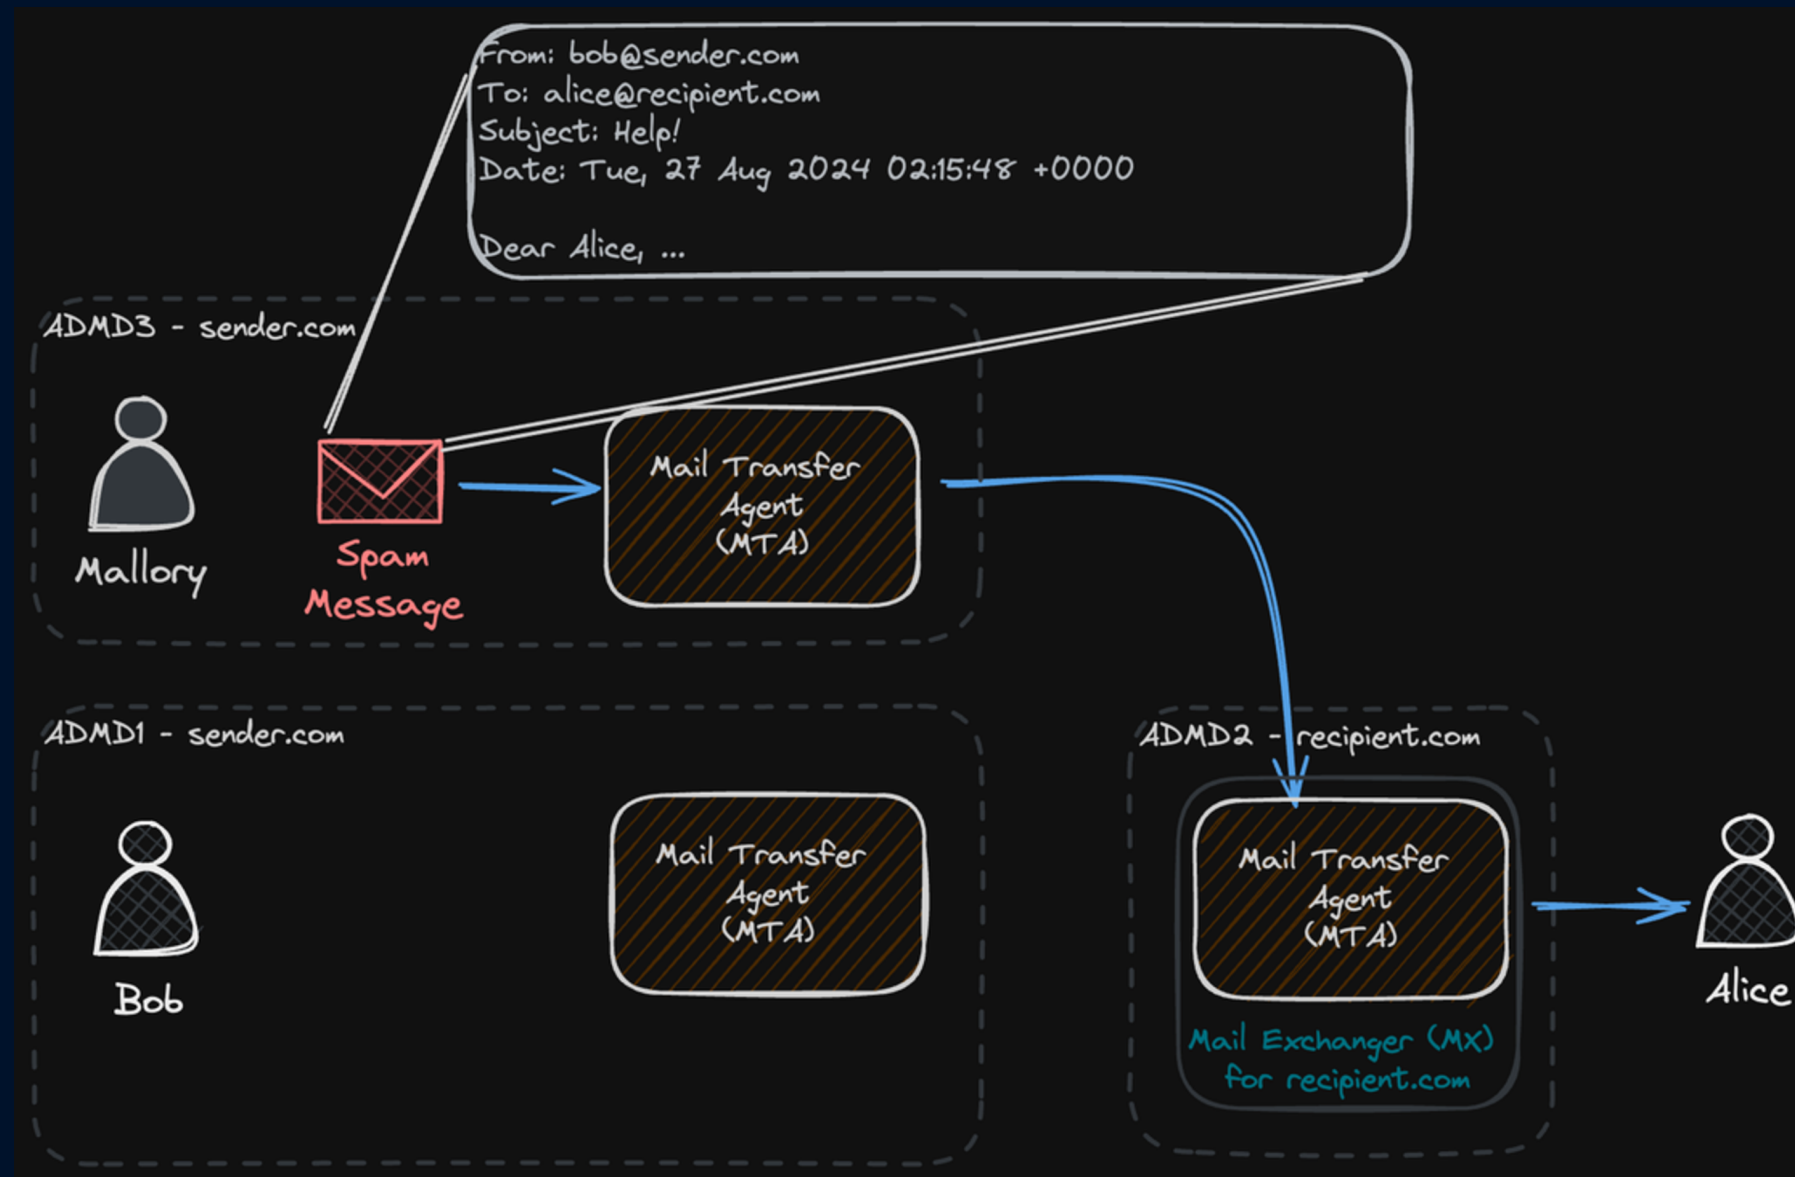

## SMTP PROBLEMS

- Sender Spoofing is the creation of email messages with a forged sender address, typically intended to mislead the recipient.
- In this example, Mallory sends a message to Alice pretending to be Bob.
- How can Alice know that the received message is from Mallory and not Bob?

# Email Authentication

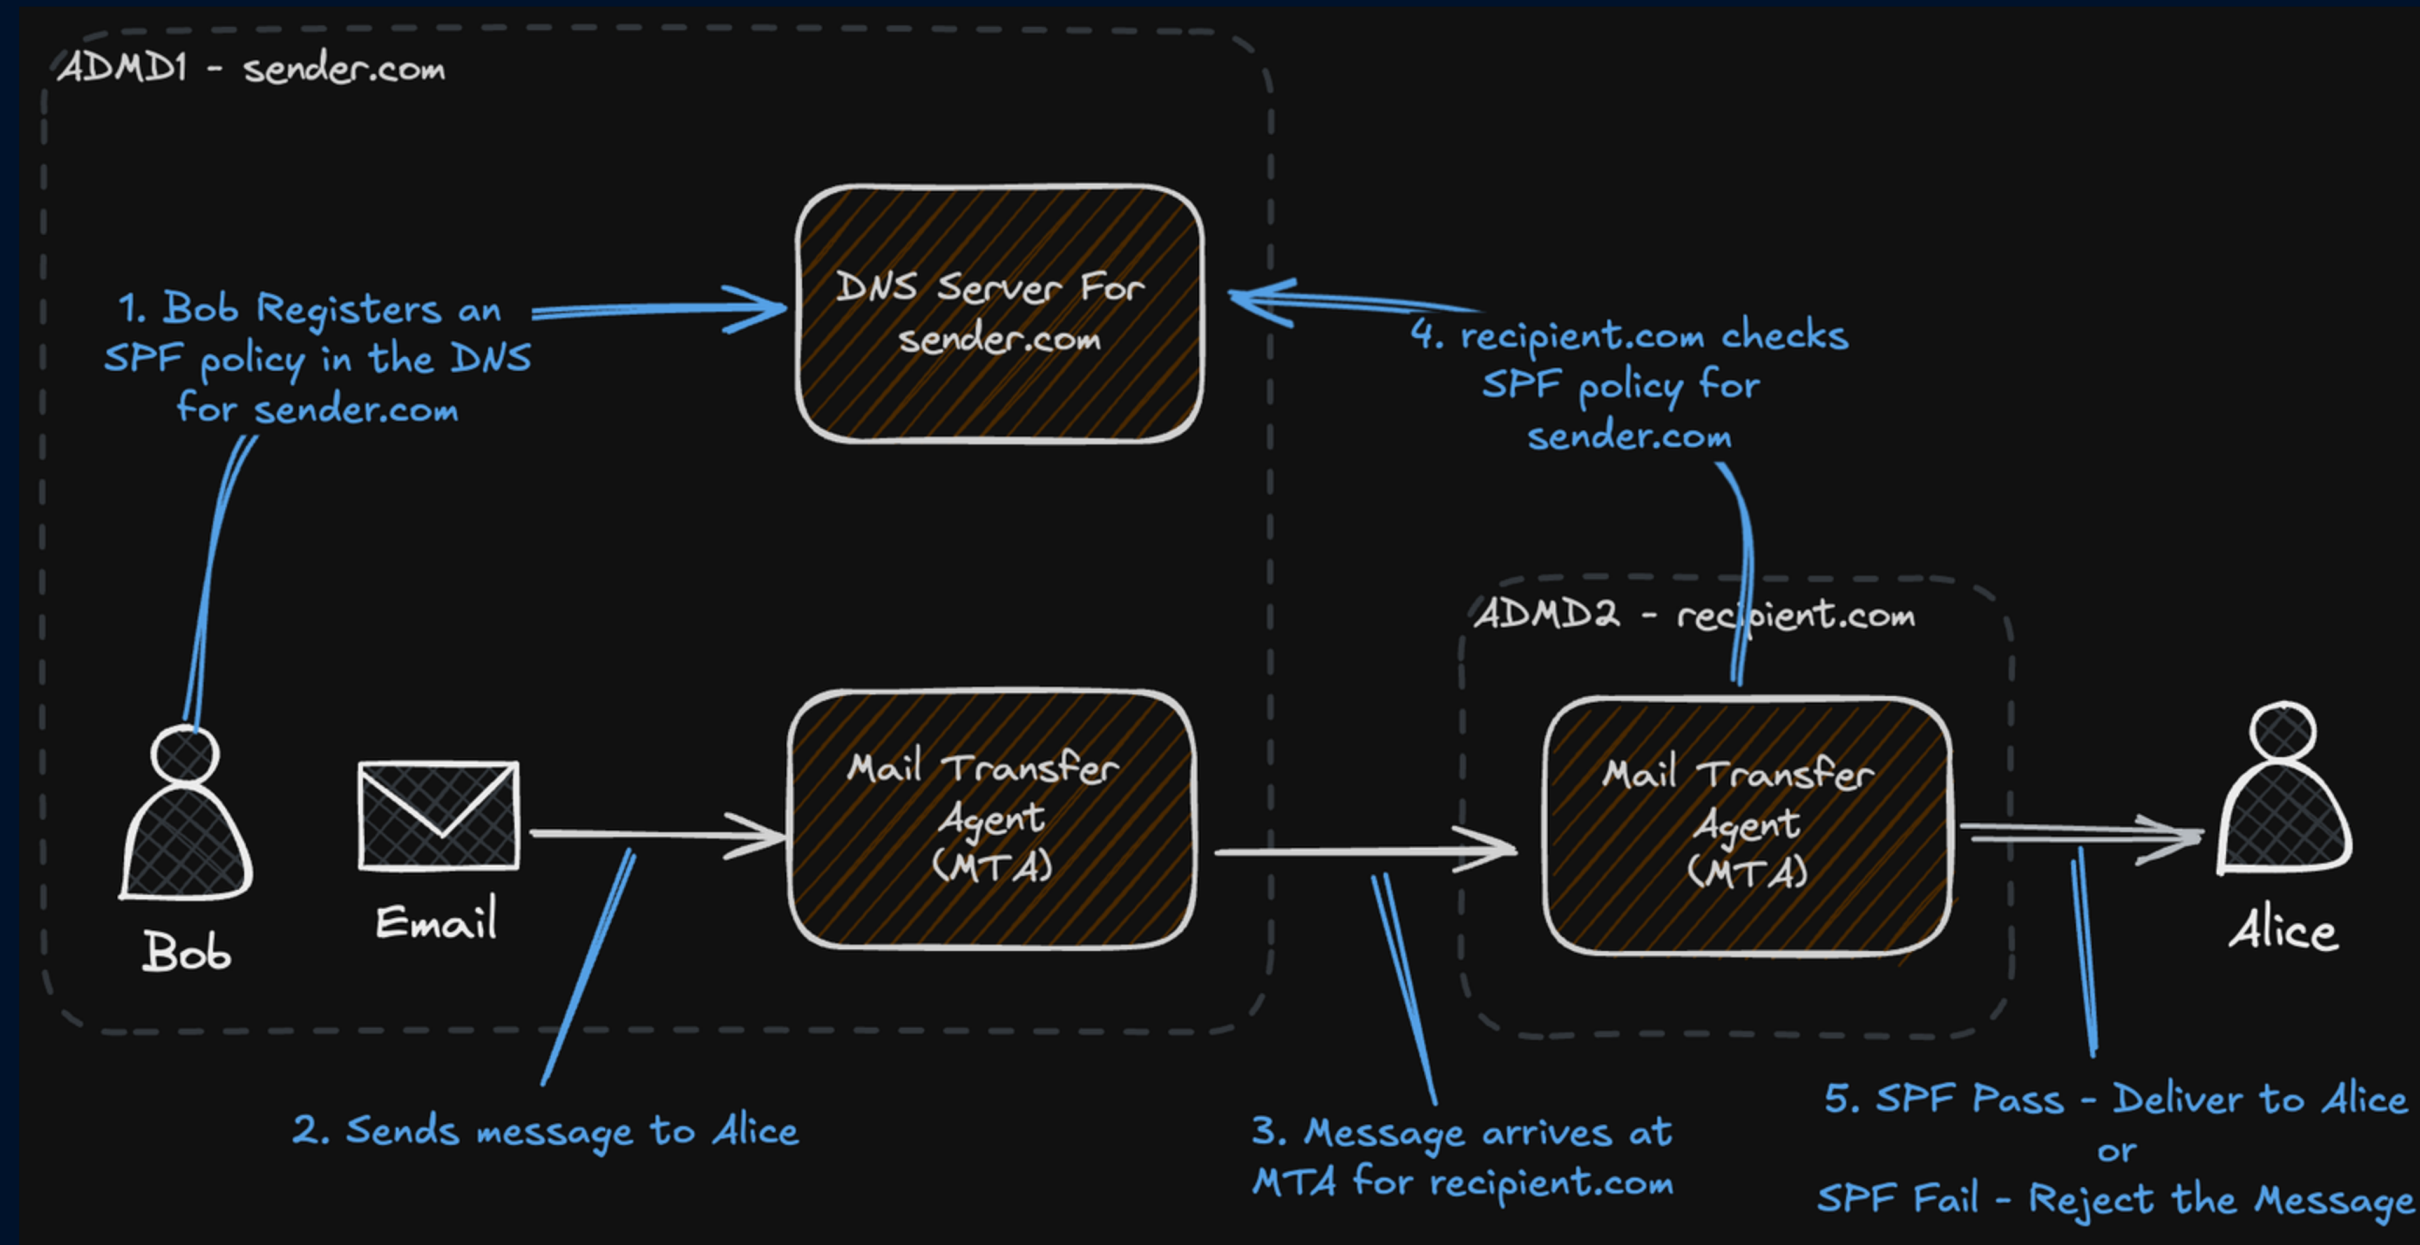

## EMAIL AUTHENTICATION

- How do we verify the sender of a message?
- How can we be sure a message did originate from the apparent sender?

# Sender Policy Framework (SPF)

## EMAIL AUTHENTICATION

- Allows domain owners to advertise which servers (IP addresses) are authorised to send mail for their domain
- Applies to the Envelope Sender address, not the From header address

# SPF - Example Record

EMAIL AUTHENTICATION

`v=spf1 ip4:203.84.134.0/23 include:spf.protection.outlook.com ~all`

SPF Version 1

Match Network Range 203.84.134.0/23

Include Policy from spf.protection.outlook.com

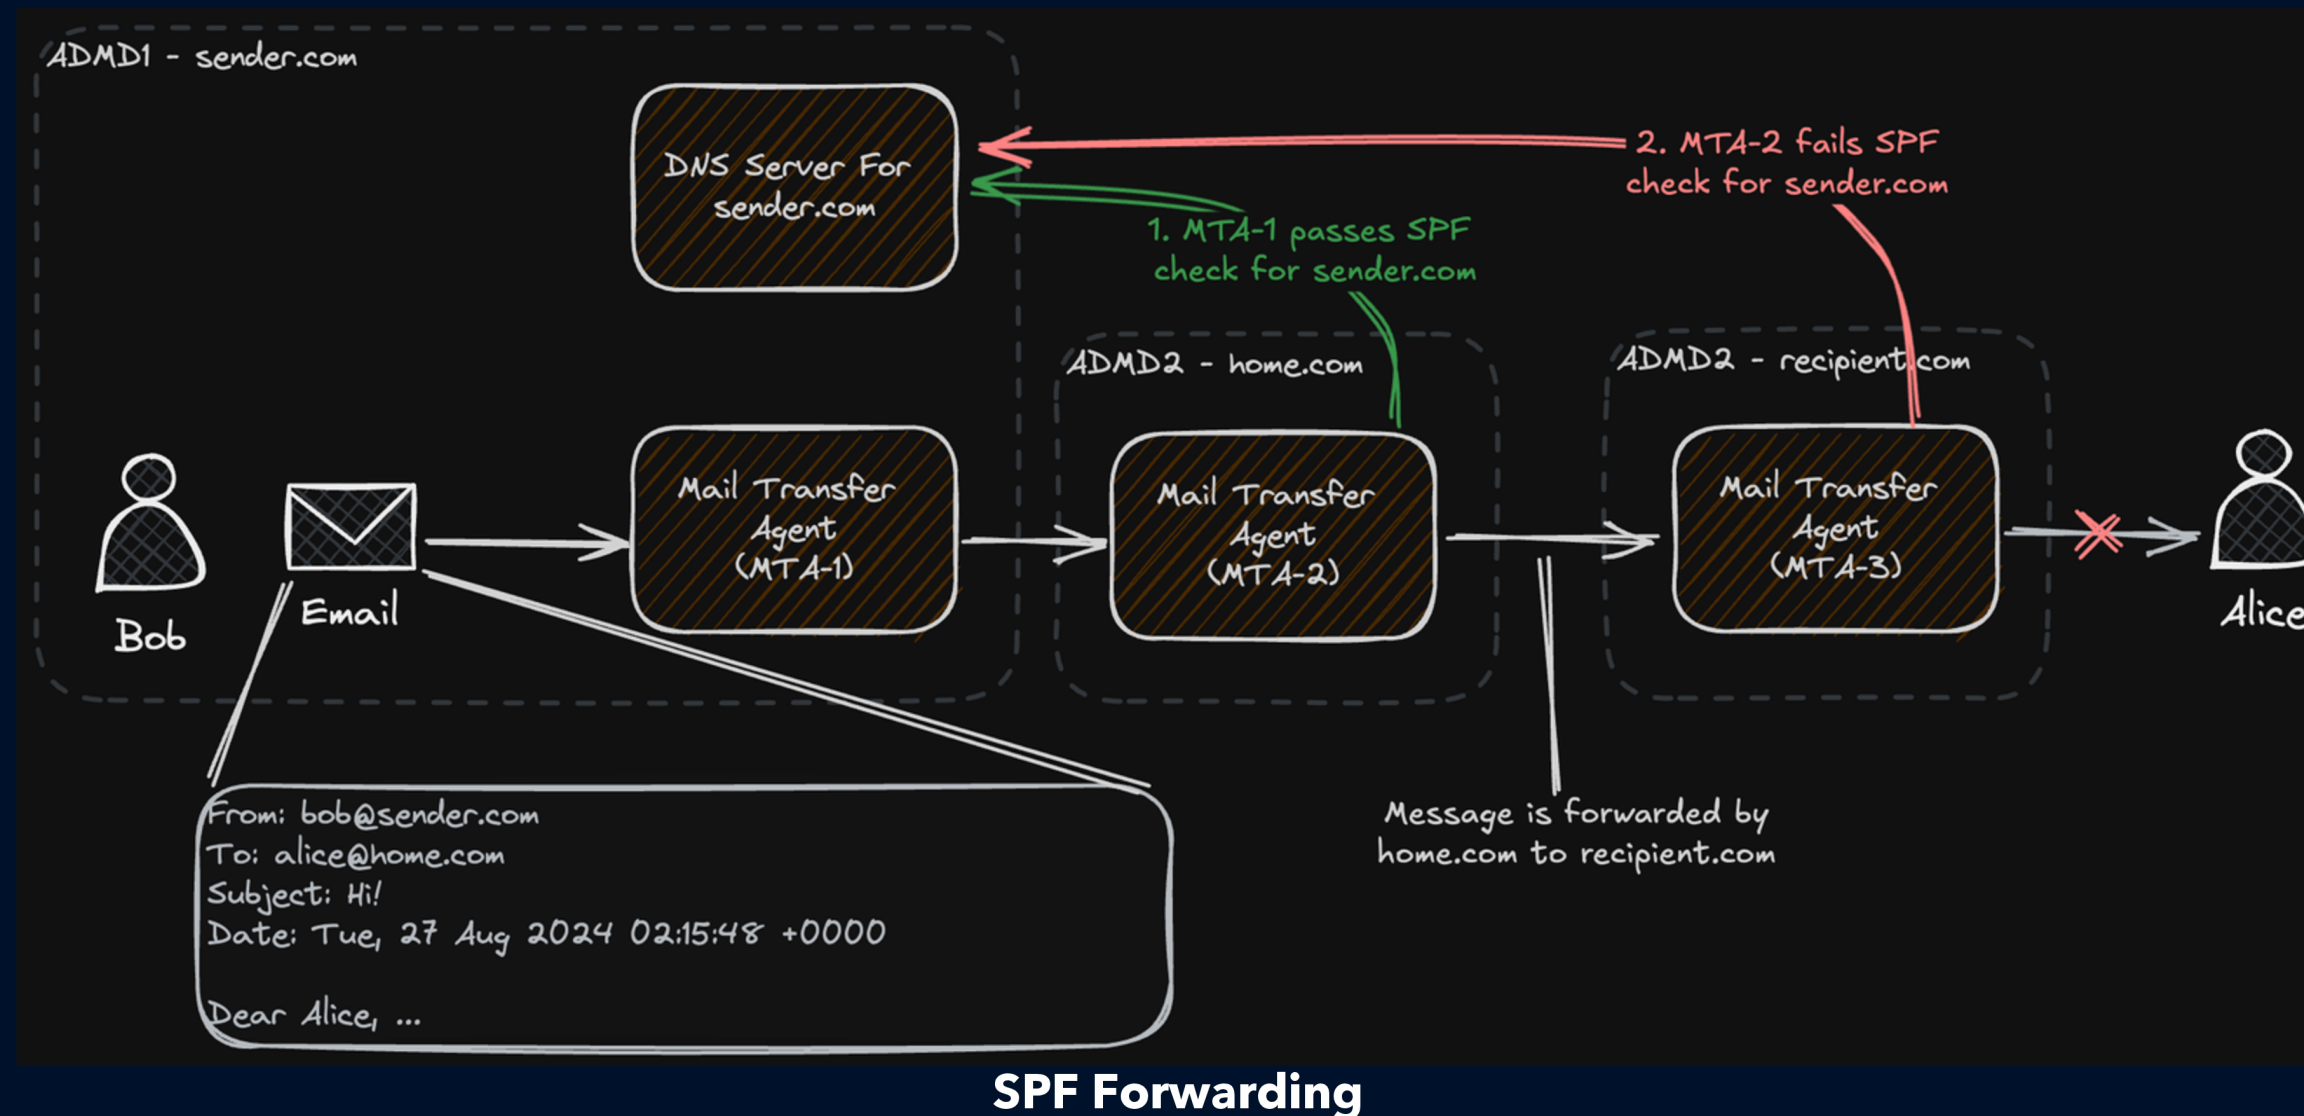

Match all other addresses (soft fail)

Record	Result	Description
-all	fail	Explicitly disallow all hosts
~all	softfail	Weak disapproval. Receivers should not reject mail on the basis of a softfail result alone.
?all	neutral	Neutral - Neither allowed nor disallowed
+all	pass	Pass all hosts

# SPF - Weaknesses

## EMAIL AUTHENTICATION

- Doesn't work well with forwarding and mailing lists. SPF checks fail at the onward destination.
- DNS size limits.
- Only protects the envelope sender, allowing for From header spoofing. I.e. the address the recipient sees.

# DomainKeys Identified Mail (DKIM)

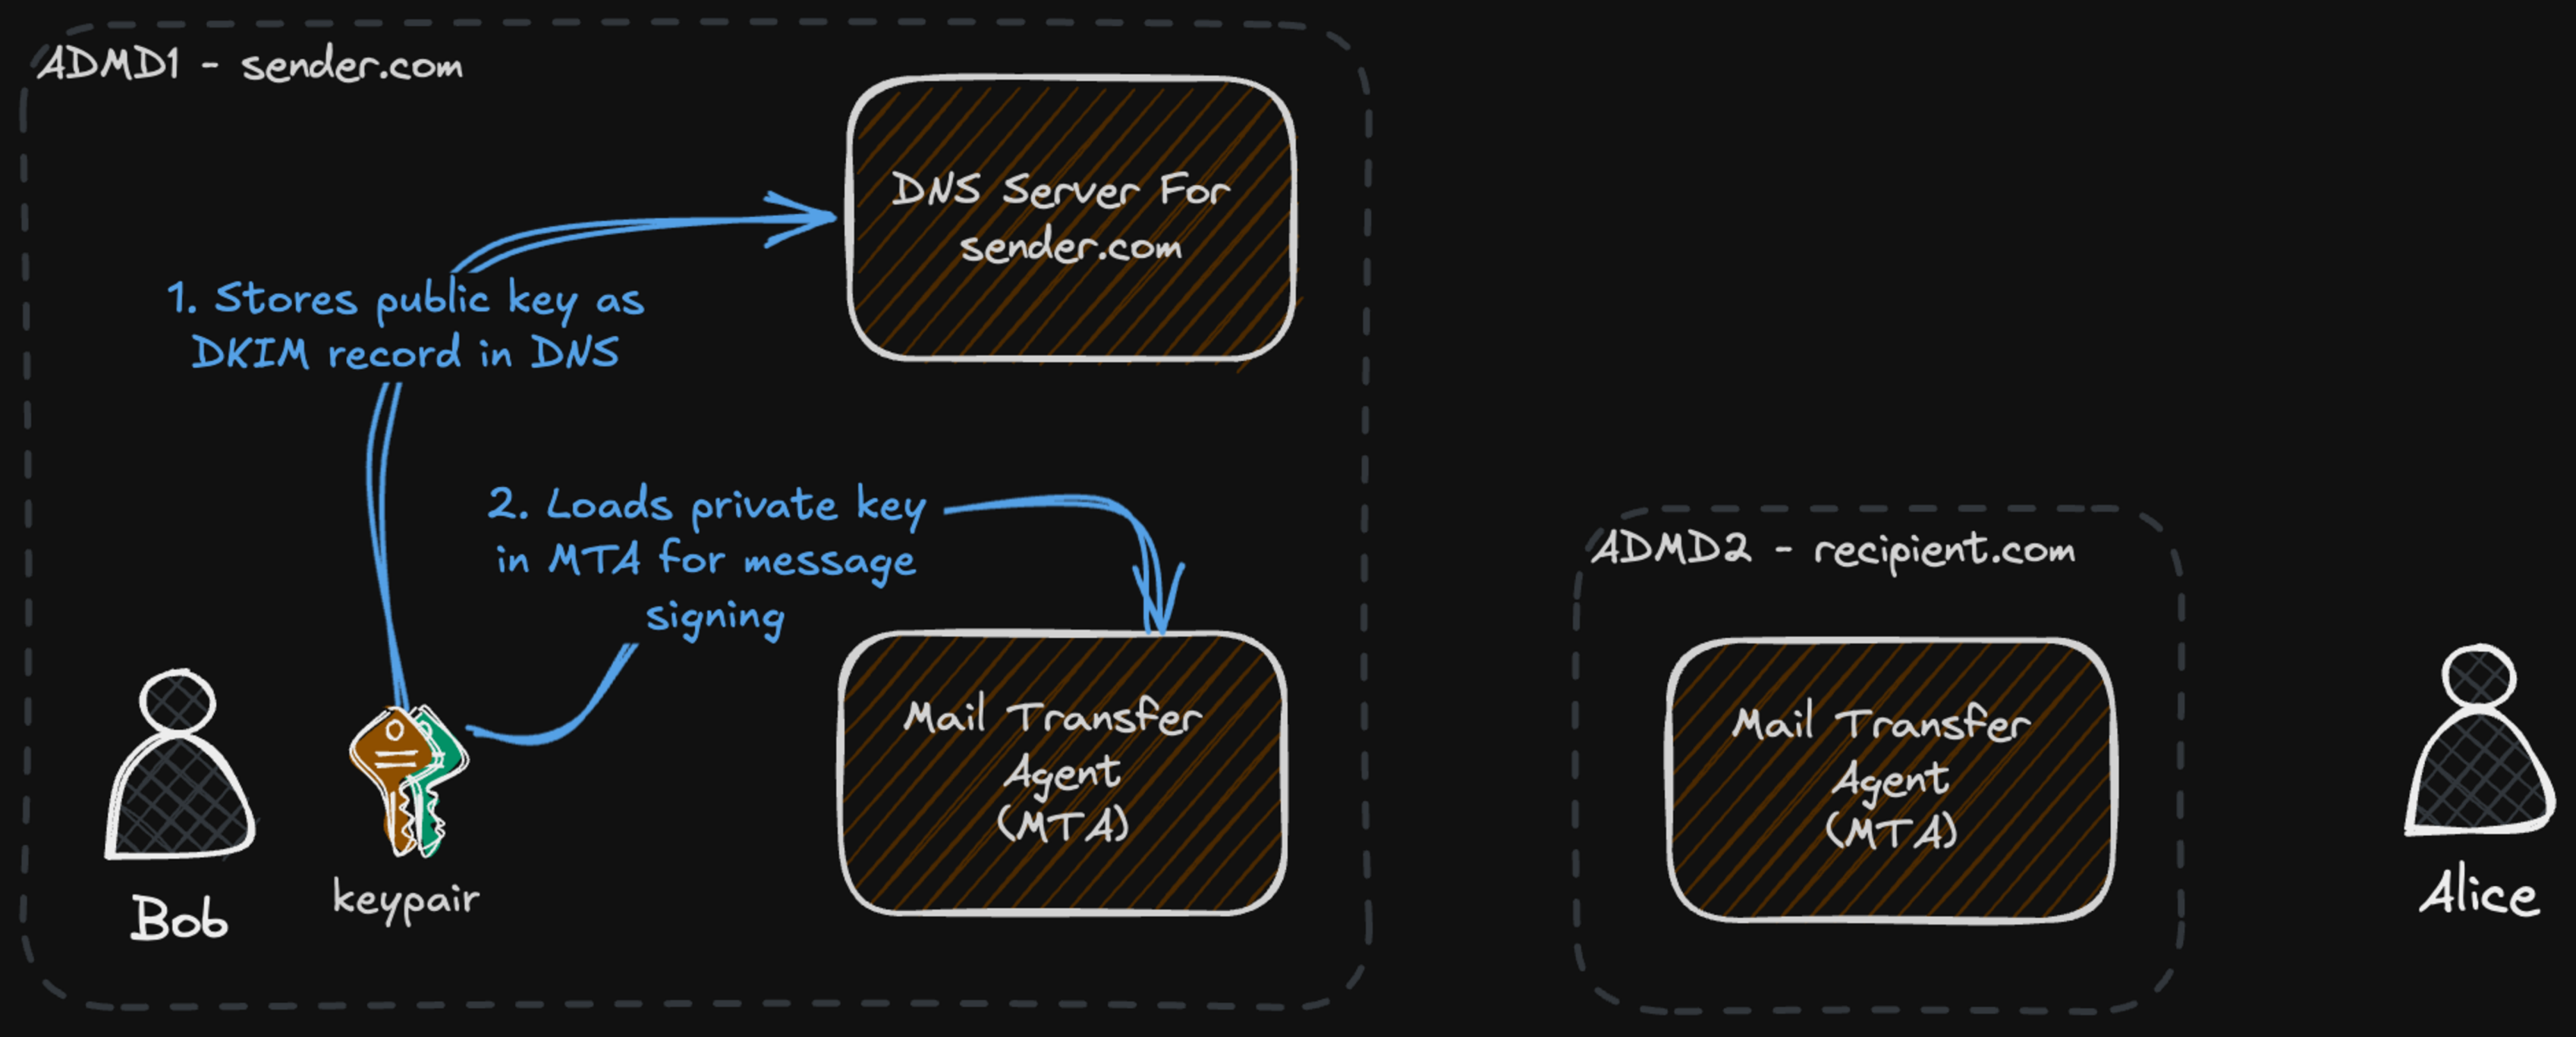

## EMAIL AUTHENTICATION

- An email authentication method based on digital signatures
- Verifies the sender's domain and ensures email integrity
- Adds a cryptographic signature to the email headers
- Receiving servers validate the signature using the sender's public key
- Addresses some of the deficiencies of SPF

# DKIM Setup

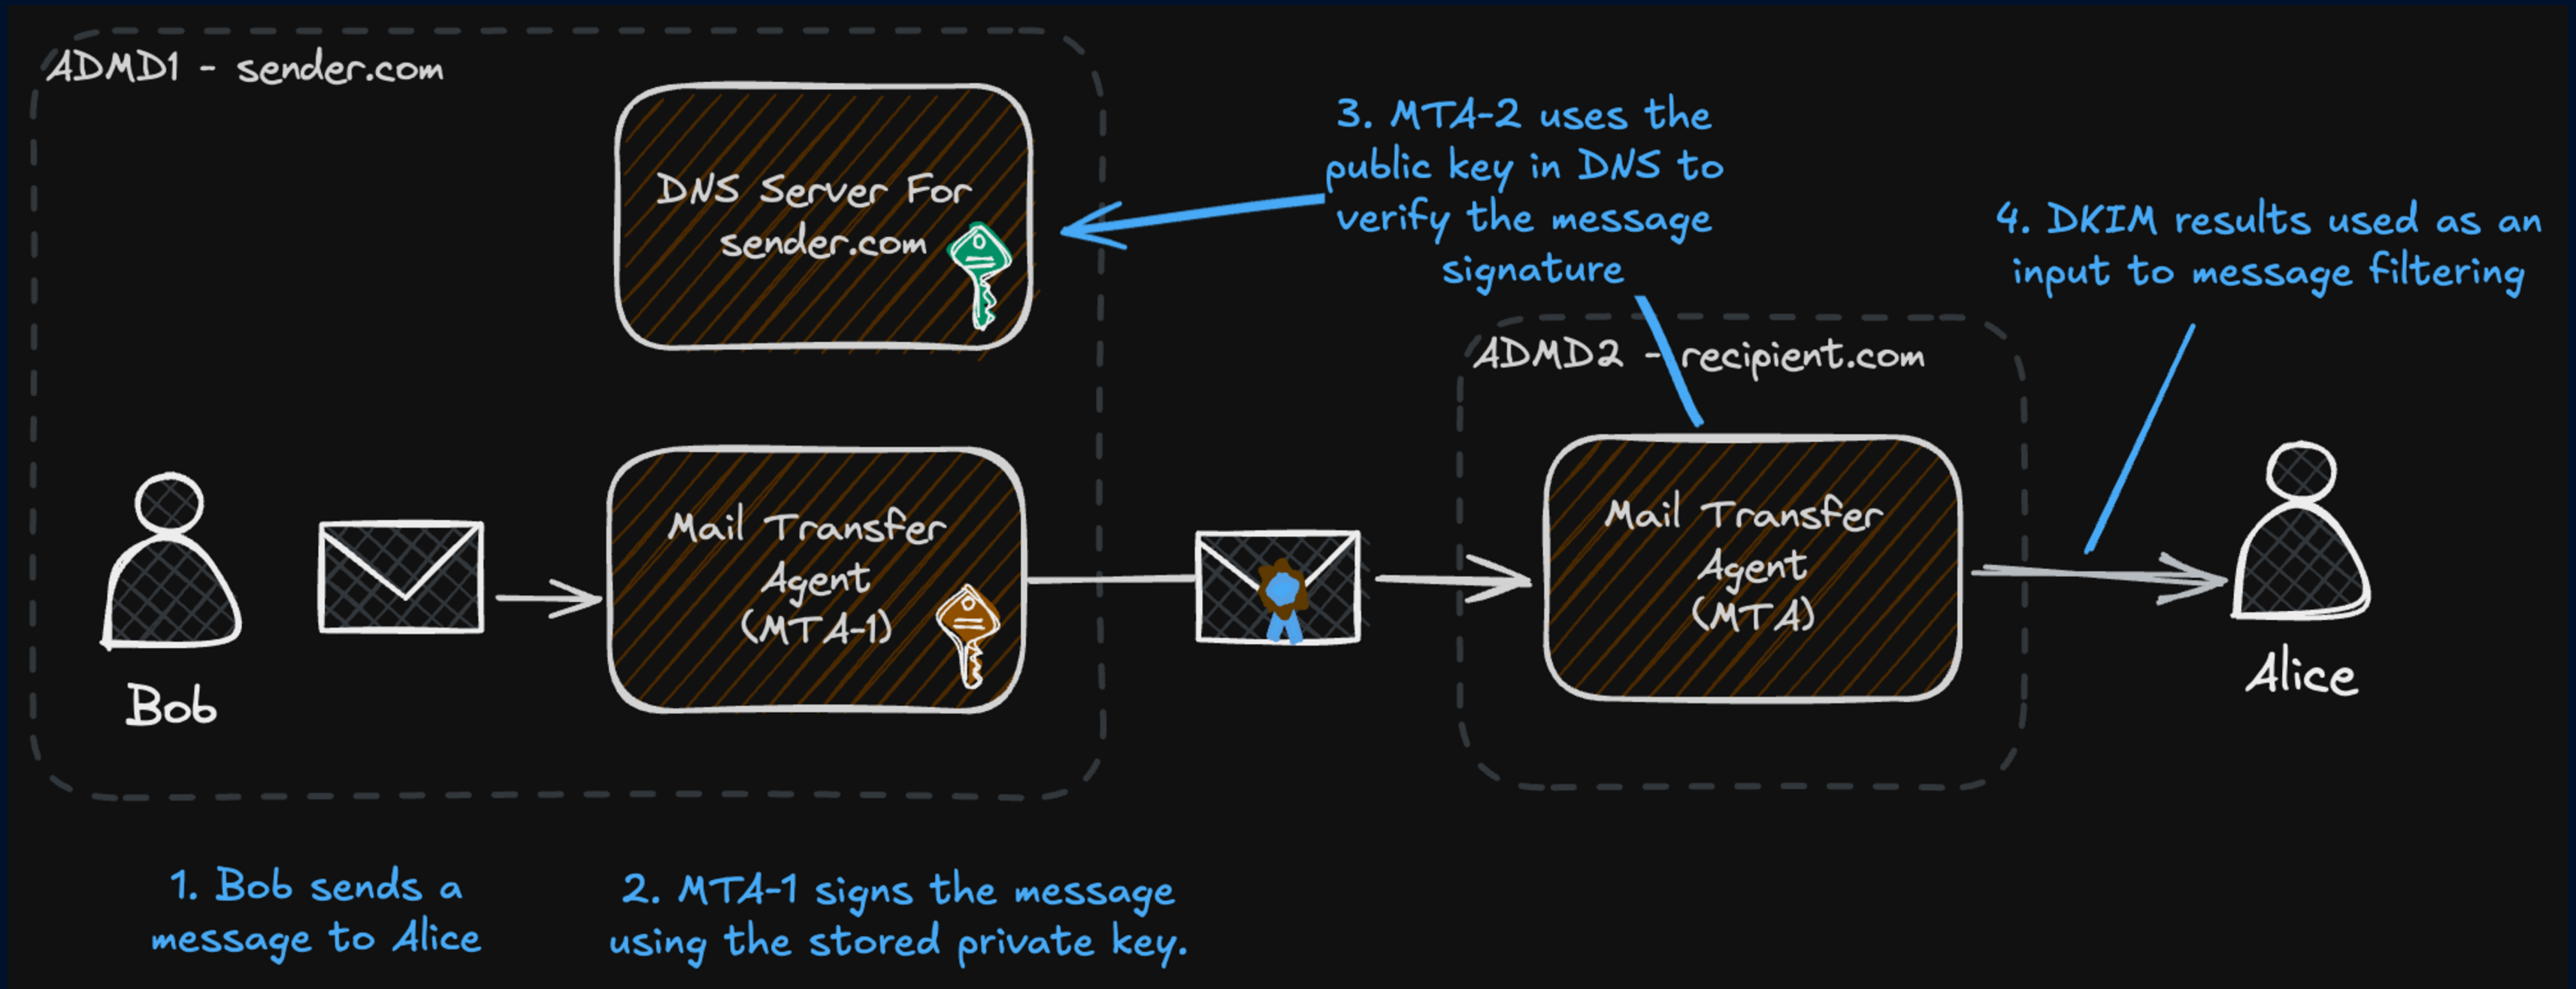

EMAIL AUTHENTICATION

# DKIM Signing and Verification

EMAIL AUTHENTICATION

# DKIM Strengths and Weaknesses

## EMAIL AUTHENTICATION

### Strengths

- Content integrity: DKIM verifies that the email content hasn't been altered in transit
- Forwarding compatibility: DKIM signatures remain valid when emails are forwarded
- Non-repudiation: Provides cryptographic proof of email origin, which SPF doesn't offer.

### Weaknesses

- Again, doesn't necessarily protect the From header.
- Vulnerable to replay attacks.

# DMARC

## EMAIL AUTHENTICATION

### Authentication Alignment

Requires that the From header domain aligns to a domain verified by SPF or DKIM

### Policy Enforcement

Allows domain owners specify how receiving mail servers should handle messages that fail authentication. Policies include:

- none - monitor only
- quarantine - treat as suspicious
- reject

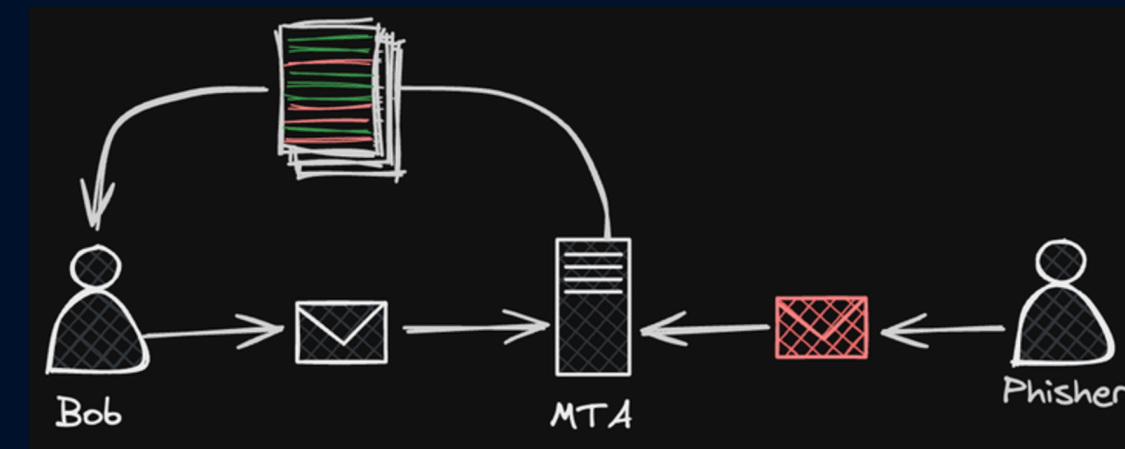

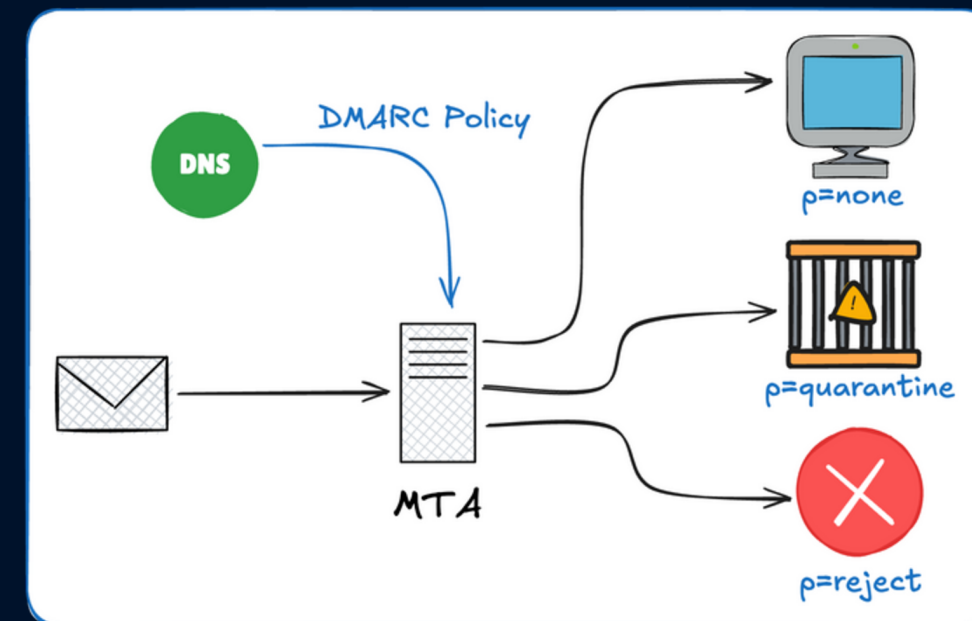

### Reporting

Provides domain owners with detailed reports about emails sent using their domain

From: Richard Gray <richard.gray@smxemail.com>

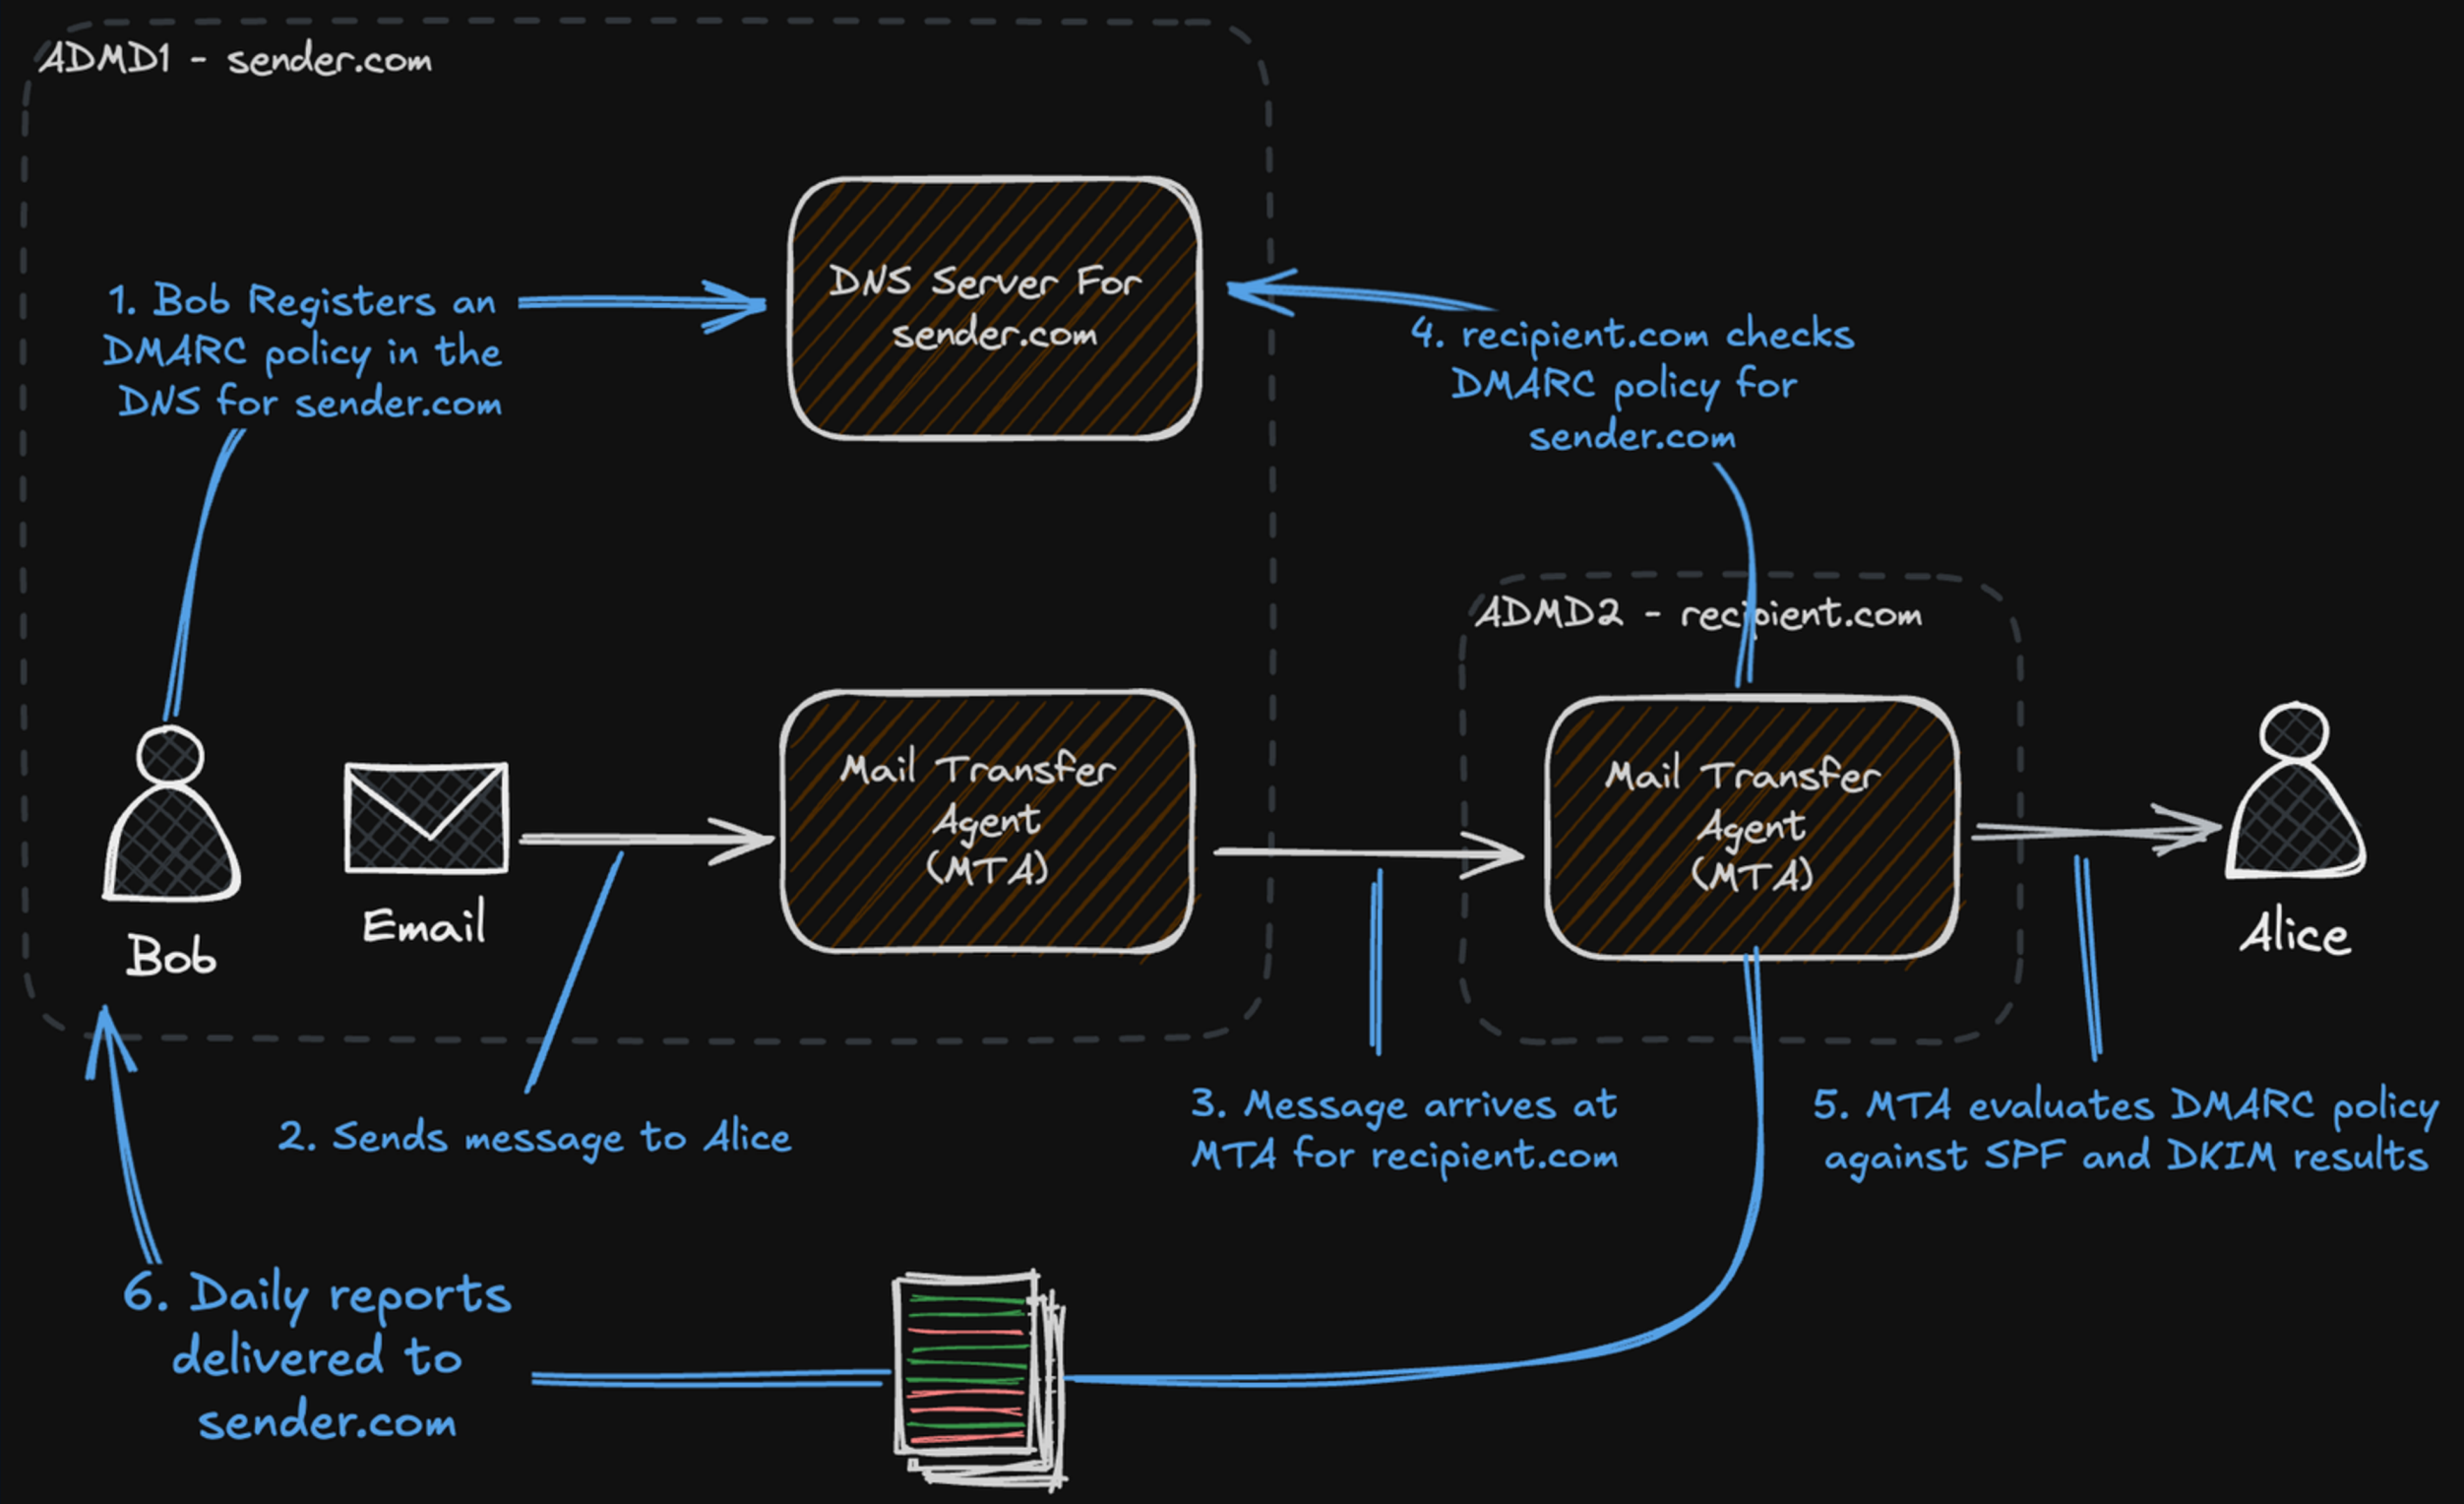

SPF Domain: smxemail.com

DKIM Signature Domain: smxemail.com

# DMARC Process

## EMAIL AUTHENTICATION

# DMARC Record

EMAIL AUTHENTICATION

```
v=DMARC1; p=reject; rua=mailto:dmarcreports@smxemail.com;
```

DMARC Version 1

Policy: Reject messages that fail DMARC auth

Deliver aggregate reports to [dmarcreports@smxemail.com](mailto:dmarcreports@smxemail.com)

# Why Should I Care?

## EMAIL AUTHENTICATION

### Brand Protection

- DMARC safeguards your brand's reputation by preventing unauthorized use of your domain.
- Builds trust with your email recipients.
- Protects your staff, suppliers, and customers from phishing and other scams.

### Deliverability

- From 2024, Google and Yahoo require that all senders implement SPF or DKIM, and that bulk senders also implement DMARC.
- Failure to comply with this requirement will result in messages being rejected or marked as Spam.

### Compliance

- For government agencies, or organisations providing services to government, use of DMARC is now mandated by NZISM.

# Recommendations - Summary

## RECOMMENDATIONS

**DMARC with an enforcing policy is essential**

**Start with p=none and consume reports into a DMARC report analyzer**

**Identify legitimate mail services and configure them for DKIM and SPF (both is best)**

**Transition to DMARC enforcement**

# Recommendations - SPF

## RECOMMENDATIONS

**Add legitimate  
mail sources to  
your SPF record**

**Prefer softfail (~all)  
(but hard fail is  
okay too)**

**Validate your SPF  
record**

# Recommendations - DKIM

## RECOMMENDATIONS

**Configure DKIM  
signing on  
legitimate mail  
services**

**Make sure the  
DKIM signing  
domain aligns with  
your email sending  
domain**

**Validate your  
record**

```
DKIM-Signature: v=1; a=rsa-sha256; c=relaxed/relaxed; d=nz.smxemail.com;  
... SNIP ...
```

```
From: SMX Limited <sales@comms.smxemail.com>
```

Organisational Domains  
are aligned

# SMX DMARC STATS

## STATISTICS

**37 million**

messages in 1 week

**34 million (92%)**

messages protected by DMARC

**184K**

domains protected by DMARC

### Message Count by DMARC Policy

**Enforcing DMARC policies apply to 62% of messages, but only 32% of domains**

# The NZ DMARC Landscape

## STATISTICS

**18 million**  
NZ messages protected by DMARC

**29K**  
NZ domains protected by DMARC

### Message Count by DMARC Policy

### Domain Count by DMARC Policy

# NZ Top Senders

## STATISTICS

### NZ Top Senders - Overall

Rank	Domain	DMARC Policy
1	site.trademe.co.nz	reject
2	mail.ezibuy.co.nz	reject
3	edm.briscoes.co.nz	reject
4	comms.everydayrewards.co.nz	reject
5	mail-grabone.co.nz	none
6	digitalcomms.airnz.co.nz	reject
7	mail.trademe.co.nz	reject
8	flybuys.co.nz	quarantine
9	e.farmers.co.nz	none
10	neighbourly.co.nz	reject

### NZ Top Senders - Government

Rank	Domain	DMARC Policy
1	msd.govt.nz	reject
2	ironline.ird.govt.nz	quarantine
3	nzta.govt.nz	none
4	aucklandcouncil.govt.nz	none
5	employment.govt.nz	none
6	companies.govt.nz	none
7	mail.aucklandlibraries.govt.nz	reject
8	qldc.govt.nz	none
9	news.aucklandcouncil.govt.nz	reject
10	doc.govt.nz	quarantine

# Homework!

1. Check the DMARC record for your domain!

a. Do you have one?

b. Is it valid?

c. What policy is being used? none, quarantine, or reject?

d. Where are the reports going?

2. Check the SPF record for your domain!

a. Do you have one?

b. Is it valid?

**Thank you!**
